- ① : Panasonic Corporation
- ② : Model Name
- ③ : SEER Grading
- ④ : SCOP Grading (Standard, mandatory)
- ⑤ : SCOP Grading (Warmer, optional)
- ⑥ : SCOP Grading (Colder, optional)
- ⑦ : Design Load kW (round up to one decimal) <Cooling>
- ⑧ : SEER (round up to one decimal)
- ⑨ : Annual Energy Consumption (rounded <Cooling> up to the nearest integer)
- ⑩ : Design Load kW (round up to one decimal) <Heating>
- ⑪ : SCOP (round up to one decimal) <Heating>
- ⑫ : Annual Energy Consumption (rounded up to the nearest integer) <Heating>
- ⑬ : Sound Power level for all indoor units dB (cooling)
- ⑭ : Sound Power level for all outdoor units dB (cooling)
- ⑮ : Sound Power level for all indoor units dB (heating)
- ⑯ : Sound Power level for all outdoor units dB (heating)
- ⑰ : backup heating capacity X,Y,Z kW name of refrigerant and GWP R410A (GWP 1975)
- ⑱ : Refrigerant leakage contributes to climate change. Refrigerant with lower global warming potential (GWP) would contribute less to global warming than a refrigerant with higher GWP, if leaked to the atmosphere. This appliance contains a refrigerant fluid with a GWP equal to 1975. This means that if 1 kg of this refrigerant fluid would be leaked to the atmosphere, the impact on global warming would be 1975 times higher than 1 kg of CO<sub>2</sub>, over a period of 100 years. Never try to interfere with the refrigerant circuit yourself or disassemble the product yourself and always ask a professional.
- ⑳ : Explanation on annual energy consumption based on standard test results. Actual energy consumption will depend on how the appliance is used and where it is located.

Information requirements for air-to-air air conditioners

Model(s): Outdoor Unit U-125PE1E5A X4  
 Indoor Unit S-36PUZE5A  
 Outdoor side heat exchanger of air conditioner:  
 Indoor side heat exchanger of air conditioner:  
 Type: compressor driven vapour compression or sorption process  
 if applicable; driver of compressor: [electric motor or fuel driven,  
 gaseous or liquid fuel, internal or external combustion engine]  
 electric motor

\*\* If  $C_{de}$  is not determined by measurement then the default degradation coefficient air conditioners shall be 0.25.  
\*\*\* from 26 September 2018.

Where information relates to multi-split air conditioners, the test result and performance data may be obtained on the basis of the performance of the outdoor unit, with a combination of indoor unit(s) recommended by the manufacturer or importer.

Information requirements for heat pumps

Model(s): Outdoor Unit U-125PE1E5A  
Indoor Unit S-125PU2E5A

Outdoor side heat exchanger of heat pump: air  
Indoor side heat exchanger of heat pump: air  
Indication if the heater is equipped with a supplementary heater: no  
if applicable: driver of compressor: [electric motor or fuel driven, electric motor]  
gaseous or liquid fuel, internal or external combustion engine]

Parameters shall be declared for the average heating season, parameters for the warmer and colder heating seasons are optional.

Information requirements for air-to-air air conditioners

Model(s): Outdoor Unit U-125PE1E8A X4  
 Indoor Unit S-36PUZE5A air  
 Outdoor side heat exchanger of air conditioner: air  
 Indoor side heat exchanger of air conditioner: air  
 Type: compressor driven vapour compression or sorption process vapour compression  
 if applicable: driver of compressor: [electric motor or fuel driven, electric motor]  
 gaseous or liquid fuel, internal or external combustion engine] electric motor

\*\* If C<sub>de</sub> is not determined by measurement then the default degradation coefficient air conditioners shall be 0.25.  
 \*\*\* from 26 September 2018.  
 Where information relates to multi-split air conditioners, the test result and performance data may be obtained on the basis of the performance of the outdoor unit, with a combination of indoor unit(s) recommended by the manufacturer or importer.

Information requirements for heat pumps

Model(s): Outdoor Unit U-125PE1E8A X4  
 Indoor Unit S-36PUZE5A air  
 Outdoor side heat exchanger of heat pump: air  
 Indoor side heat exchanger of heat pump: air  
 Indication if the heater is equipped with a supplementary heater: no  
 if applicable: driver of compressor: [electric motor or fuel driven, electric motor]  
 gaseous or liquid fuel, internal or external combustion engine] electric motor  
 Parameters shall be declared for the average heating season, parameters for the warmer and colder heating seasons are optional.

Information requirements for air-to-air air conditioners

Model(s): Outdoor Unit U-140PE1E5A  
Indoor Unit S-140PN1E5A

Outdoor side heat exchanger of air conditioner: air

Indoor side heat exchanger of air conditioner: air

Type: compressor driven vapour compression or sorption process vapour compression

if applicable: driver of compressor: [electric motor or fuel driven, electric motor, gaseous or liquid fuel, internal or external combustion engine]

Information requirements for air-to-air air conditioners

Model(s): Outdoor Unit U-125PE1E8A  
Indoor Unit S-60PN1E5A x2

Outdoor side heat exchanger of air conditioner: air

Indoor side heat exchanger of air conditioner: air

Type: compressor driven vapour compression or sorption process vapour compression

if applicable: driver of compressor: [electric motor or fuel driven, gaseous or liquid fuel, internal or external combustion engine] electric motor

Information requirements for heat pumps

Model(s): Outdoor Unit U-140PE1E8A  
Indoor Unit S-140PN1E5A

Outdoor side heat exchanger of heat pump: air

Outdoor side heat exchanger of heat pump: air

Indication if the heater is equipped with a supplementary heater: no

if applicable: driver of compressor: [electric motor or fuel driven, gaseous or liquid fuel, internal or external combustion engine]  
electric motor

Parameters shall be declared for the average heating season, parameters for the warmer and colder heating seasons are optional.

### Information requirements for air-to-air air conditioners

Model(s): U-140PEY1E8 X2  
S-71PT2E5A

Outdoor Unit  
Indoor Unit

Outdoor side heat exchanger of air conditioner:  
Indoor side heat exchanger of air conditioner:  
Type: compressor driven vapour compression or sorption process  
if applicable; driver of compressor: [electric motor or fuel driven,  
gaseous or liquid fuel, internal or external combustion engine]

air  
air  
vapour compression  
electric motor

| Item  | Symbol   | Value    | Unit | Item   | Symbol  | Value | Unit                              |
|---|--|----------|------|--|---|-------|-----------------------------------|
| Rated cooling capacity  | $P_{rated,c}$  | 14.0     | kW   | Seasonal space cooling energy efficiency   | $\eta_{s,c}$  | 217.0 | %                                 |
| Refrigeration load  | $P_{design,c}$   | 14.0     | kW   |  |   |       |                                   |
| Declared cooling capacity for part load at given outdoor temperatures T <sub>j</sub> and indoor 27°/19°C (dry/wet bulb)                             |  |          |      |  |   |       |                                   |
|   |  | 14.0     | kW   | T <sub>j</sub> = + 35 °C   |   | 2.9   | %                                 |
|   |  | 10.3     | kW   | T <sub>j</sub> = + 30 °C   | EER <sub>d</sub> or GUE <sub>o,ah</sub> /                     | 3.9   | %                                 |
|   | P <sub>dc</sub>  | 6.6      | kW   | T <sub>j</sub> = + 25 °C   | AEF <sub>o,ah</sub>   | 6.4   | %                                 |
|   |  | 5.3      | kW   | T <sub>j</sub> = + 20 °C   |   | 10.1  | %                                 |
| Degradation co- efficient for air conditioners**  | C <sub>dc</sub>  | 0.25     | -    |  |   |       |                                   |
| Declared energy efficiency ratio or gas utilization efficiency / auxiliary energy factor for part load at given outdoor temperatures T <sub>j</sub> |  |          |      |  |   |       |                                   |
|   |  | 12.3     | kW   | T <sub>j</sub> = - 7 °C  |   | 2.2   | %                                 |
|   |  | 7.5      | kW   | T <sub>j</sub> = + 2 °C  |   | 3.4   | %                                 |
|   |  | 4.8      | kW   | T <sub>j</sub> = + 7 °C  |   | 5.1   | %                                 |
|   |  | 4.5      | kW   | T <sub>j</sub> = + 12 °C   |   | 6.4   | %                                 |

Information requirements for air-to-air air conditioners

Model(s): Outdoor Unit U-140PEY1E8 Indoor Unit S-140PF1E5A

Outdoor side heat exchanger of air conditioner: air

Indoor side heat exchanger of air conditioner: air

Type: compressor driven vapour compression or sorption process vapour compression

if applicable: driver of compressor: electric motor or fuel driven, electric motor

gaseous or liquid fuel, internal or external combustion engine

2-1. Preparing for Test Run

● Before attempting to start the air conditioner, check the following:

- (1) All loose matter is removed from the cabinet especially steel filings, bits of wire, and clips.
- (2) The control wiring is correctly connected and all electrical connections are tight.
- (3) The protective spacers for the compressor used for transportation have been removed. If not, remove them now.
- (4) The transportation pads for the indoor fan have been removed. If not, remove them now.
- (5) Both the gas and liquid tube service valves are open. If not, open them now.

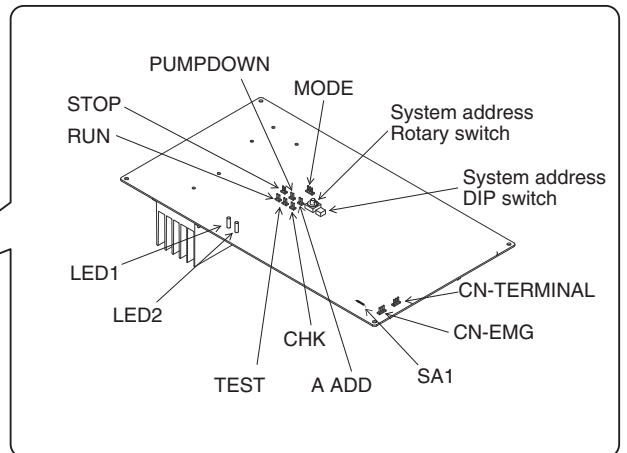

- (6) Request that the customer be present for the test run. Explain the contents of the instruction manual, and then have the customer actually operate the system.
- (7) Be sure to give the instruction manual and warranty certificate to the customer.

● If it is necessary to make settings such as system address when performing a test run, remove the top panel and electrical component box cover as illustrated below and check each switch on the control PC board.

- (1) Remove the top panel by unfastening five screws.

- (2) To remove the electrical component box cover, press the latches on the cover in the direction of the arrow while holding the handle with one hand.

**2-2. Caution**

- This unit may be used in a single-type refrigerant system where 1 outdoor unit is connected to 1 indoor unit.
- The indoor and outdoor unit control PCB utilizes a semiconductor memory element (EEPROM). The settings required for operation were made at the time of shipment. Only the correct combinations of indoor and outdoor units can be used.
- This test run section describes primarily the procedure when using the wired remote controller. Regarding the wireless remote controller, refer to the Installation Instructions attached to the wireless remote controller.

**2-3. Test Run Procedure**

**2-4. Items to Check Before the Test Run**

Fully open the closed valves on the liquid-tube and gas-tube sides.

## 2-5. Test Run Using the Remote Controller

### High-spec Wired Remote Controller (CZ-RTC5A)

- Keep pressing the , and buttons simultaneously for 4 or more seconds. The "Maintenance func" screen appears on the LCD display.

- Press the or button to see each menu. If you wish to see the next screen instantly, press the or button. Select "4. Test run" on the LCD display and press the button.

Change the display from OFF to ON by pressing the or button. Then press the button.

### Timer remote controller (CZ-RTC4)

- Press the remote controller button for 4 seconds or longer. Then press the button.

- "TEST" appears on the LCD display while the test run is in progress.
  - The temperature cannot be adjusted when in Test Run mode. (This mode places a heavy load on the machines. Therefore use it only when performing the test run.)
- The test run can be performed using the HEAT, COOL, or FAN operation modes.

**NOTE**

The outdoor units will not operate for approximately 3 minutes after the power is turned ON and after operation is stopped.

- If correct operation is not possible, a code is displayed on the remote controller LCD display. (See the section "2-10. Table of Self-Diagnostic Functions and Corrections" and correct the problem.)
- After the test run is completed, press the button again. Check that "TEST" disappears from the LCD display. (To prevent continuous test runs, this remote controller includes a timer function that cancels the test run after 60 minutes.)

\* If the test run is performed using the wired remote controller, operation is possible even if the cassette-type ceiling panel has not been installed. ("P09" display does not occur.)

- Press the button. "TEST" will be displayed on the LCD display.

- Press the button. Test run will be started. Test run setting mode screen appears on the LCD display.

## 2-6. Precautions

- Request that the customer be present when the test run is performed. At this time, explain the operation manual and have the customer perform the actual steps.
- Be sure to pass the manuals and warranty certificate to the customer.
- Check that the 220 – 240 V AC power is not connected to the inter-unit control wiring connector terminal.

\* If 220 – 240 V AC is accidentally applied, the indoor or outdoor unit control PCB fuse will blow in order to protect the PCB. Correct the wiring connections. Remove the short connector connected to the OC side and reconnect to the EMG side on the outdoor control PCB. Cut the SA1 out of the outdoor unit control PCB. Then disconnect the 2P connectors (OC) that are connected to the indoor unit PCB, and replace them with 2P connectors (EMG). If operation is still not possible after changing the brown connectors, cut off the jumper (indoor unit) or the varistor (indoor unit) on the PCB. (Be sure to turn the power OFF before performing this work.)

### Link wiring sample

System address rotary switch on the outdoor unit PCB

## 2-8. Auto address setting using the remote controller

### High-spec Wired Remote Controller (CZ-RTC5A)

- Keep pressing the , and buttons simultaneously for 4 or more seconds.  
The "Maintenance func" screen appears on the LCD display.
- Press the or button to see each menu.  
If you wish to see the next screen instantly, press the or button.  
Select "9. Auto address" on the LCD display and press the button.

- The "Auto address" screen appears on the LCD display.  
Change the "Code no." to "A1" by pressing the or button.

- Select the "O/D unit no." by pressing the or button.

Select one of the "O/D unit no." for auto address by pressing the or button.

Approximately about 10 minutes are required.  
When auto address setting is completed, the units return to normal stopped status.

### Timer remote controller (CZ-RTC4)

Auto address setting in Cooling mode cannot be done from the remote controller.

#### NOTE

- Selecting each refrigerant system individually for auto address setting
- Auto address setting for each system  
: Item code "A1"

- Press the remote controller timer time button and button at the same time.  
(Press and hold for 4 seconds or longer.)
- Next, press either the temperature setting / button.  
(Check that the item code is "A1".)
- Use either the button to set the system No. to perform auto address setting.
- Then press the button.  
(Auto address setting for one refrigerant system begins.) (When auto address setting for one system is completed, the system returns to normal stopped status.)  
<Approximately 4 – 5 minutes is required.>  
(During auto address setting, "SETTING" is displayed on the remote controller.  
This message disappears when auto address setting is completed.)
- Repeat the same steps to perform auto address setting for each successive system.

## Display During Auto Address Setting

- On the surface of outdoor unit control P.C. board

- \* Do not short circuit the A ADD pin again during auto address setting. LEDs 1 and 2 go out and address setting is interrupted.
- \* When auto address setting is normally completed, both LEDs 1 and 2 go out. In other cases, correct settings referring to the following table and perform auto address setting again.

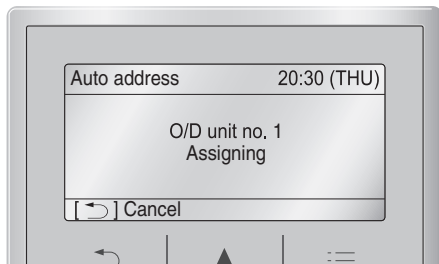

- Contents of LEDs 1 and 2 on outdoor unit control P.C. board

○ : ON    ⚙ : Blinking    ● : OFF

|  |  | LED1  | LED2 | Remark  |
|--|--|---|------|---|
| Normal operation                                     |  | ●   | ●    |   |
| Pre-trip (High pressure protection)                  |  | ⚙   | ●    | LED1 Blinking : 0.8sec-ON / 0.3sec-OFF            |
| Pre-trip (other)                                     |  | ⚙   | ●    | LED1 Blinking : 0.5sec-ON / 0.5sec-OFF            |

- Display of remote controller

### CZ-RTC5A

### CZ-RTC4

### 2-9. Indicating (marking) the indoor and outdoor unit combination number

Indicate (mark) the number after auto address setting is completed.

- So that the combination of each indoor unit can be easily checked when multiple units are installed, ensure that the indoor and outdoor unit numbers correspond to the system address number on the outdoor unit control PCB, and use a magic marker or similar means which cannot be easily erased to indicate the numbers in an easily visible location on the indoor units (near the indoor unit nameplates).

Example: (Outdoor) 1 - (Indoor) 1  
(Outdoor) 2 - (Indoor) 1

- These numbers will be needed for maintenance. Be sure to indicate them.

Use the remote controller to check the indoor unit address.

#### High-spec Wired Remote Controller (CZ-RTC5A)

- (1) Keep pressing the , and buttons simultaneously for 4 or more seconds. The "Maintenance func" screen appears on the LCD display.

- (3) The "Simple settings" screen appears on the LCD display. Select the "Unit no." by pressing the or button for changes.

- (2) Press the or button to see each menu. If you wish to see the next screen instantly, press the or button. Select "7. Simple settings" on the LCD display and press the button.

The indoor unit fan operates only at the selected indoor unit.

#### Timer remote controller (CZ-RTC4)

<If 1 indoor unit is connected to 1 remote controller>

- (1) Press and hold the button and button for 4 seconds or longer (simple settings mode).
- (2) The address is displayed for the indoor unit that is connected to the remote controller. (Only the address of the indoor unit that is connected to the remote controller can be checked.)
- (3) Press the button again to return to normal remote controller mode.

Number changes to indicate which indoor unit is currently selected.

Indoor unit address

### Contents of LED Display on the Outdoor Unit Control PCB (CR)

|  |  | LED1  | LED2 | Remark   |
|--|--|---|------|--|
| Normal operation                                     |  |   |      |  |
| Pre-trip (High pressure protection)                  |  | ○   |      | LED1 Blinking : 0.8sec-ON / 0.3sec-OFF             |
| Pre-trip (other)                                     |  | ○   |      | LED1 Blinking : 0.5sec-ON / 0.5sec-OFF             |
| Automatic address setting                            | Under automatic address setting                              | ○   | ○    | Blinking alternately                               |
|  | Automatic address setting alarm                              | ○   | ○    | Follow the blinking patterns of each alarm         |
| Alternate blinking of outdoor unit LED during alarms |  | LED1 blinks M times, and then LED2 blinks N times. The cycle then repeats.<br>M=2:P alarm, 3:H alarm, 4:E alarm, 5:F alarm, 6:L alarm, N=alarm No<br>Example: LED1 blinks 4 times, then LED2 blinks 6 times. The cycle then repeats. Alarm is "E06" |      |  |
| Power ON sequence                                    | No communication from indoor units in system                 | ●   | ●    | If it is not possible to advance to 3 repeats 1 →2 |
|  | Communication received from 1 or more indoor units in system |   | ●    | At 3, advances to normal control                   |
|  | Regular communication OK (Capacity and unit quantity match)  |   |      |  |
| Refrigerant recovery mode                            |  | ○   | ●    |  |

○ : Blinking    ● : ON

Note : In the case that inter-unit wiring is 30m or longer, you cannot pump-down.  
(It may trigger the operation of the overload protection device.)  
In this case, perform pump-down with pump-down device.

### 2-11. Auto address setting from the outdoor unit

- If the power can be turned ON separately for the indoor and outdoor units in each system:  
The indoor unit addresses can be set without running the compressor.
- Be sure to use a jig for short-circuiting.

- (1) Turn on the indoor and outdoor unit power for refrigerant system 1.  
Short-circuit the A ADD pin.

↓  
Communication for auto address setting begins.

↓  
LED 1 and 2 on the outdoor unit control PCB blink alternately, and turn OFF when address setting is completed.  
<Approximately 4 – 5 minutes are required.>

- (2) Next, turn ON the power only at the indoor and outdoor units in a different system. Short-circuit the A ADD pin.

↓  
LED 1 and 2 on the outdoor unit control PCB blink alternately, and turn OFF when address setting is completed.

↓  
Repeat the same procedure for each system and complete auto address setting.

- (3) Operation using the remote controller is now possible.

### 2-12. Test run using the Indicator of the indoor unit (Type K1)

- (1) Press and hold [Emergency Operation] ⏻ button of the indoor unit for four seconds or more.
- (2) Then the lamps on the display will blink one after another.
- (3) Release the button and again press and hold [Emergency Operation] ⏻ button for four seconds or more.
- (4) All indicator lamps on the display blink while test run is in progress.
- (5) Temperature control is not possible during the test run.
- (6) If normal operation is not possible, the lamps on the display will indicate the problem. See the section 2-10.
- (7) After the test run is completed, press [Emergency Operation] ⏻ button and confirm that the indicator lamps stop blinking.  
(A 60-minute automatic OFF timer function is included in order to prevent continuous test run.)

### 2-13. Caution for Pump Down

Pump down means refrigerant gas in the system is returned to the outdoor unit. Pump down is used when the unit is to be moved, or before servicing the refrigerant circuit.

#### CAUTION

- This outdoor unit cannot collect more than the rated refrigerant amount as shown by the nameplate on the back.
- If the amount of refrigerant is more than that recommended, do not conduct a pump down. In this case use another refrigerant collecting system.
- Pay a special attention to the rotating of the fan while operating.

#### How to perform Pump-Down (Refrigerant recovery) properly

- (1) Stop operation of the unit (cooling, heating etc.).
- (2) Connect the pressure gauge to the service port of the gas wiring valve.
- (3) Short-circuit the "PUMPDOWN" pin on an outdoor unit control PCB (CR) for more than 1 second to release.
  - Pump-Down begins and the unit starts operating.
  - During Pump-Down, LED1 blinks and LED2 is lit on an outdoor unit control PCB (CR).
  - "CHK" blinks on the remote controller.
- (4) Fully close the liquid wiring valve 2-3 minutes later.  
The Pump-Down will begin.
- (5) When the pressure gauge drops to 0.1-0.2MPa, close the gas wiring valve tightly and short-circuit the "PUMPDOWN" pin for more than 1 second to release. That is the end of Pump-Down.
  - When running for more than 10 minutes, it stops even if the Pump-Down is not completed.  
Check the blocked state of the liquid side valve.
  - It also stops when the "PUMPDOWN" pin is short-circuited during the operation.

Pay a special attention to the rotating of the fan while operating.

\* For compressor protection, do not operate to the point where the unit wiring side reaches negative pressure.

## 2-14. PRECAUTIONS REGARDING TEST RUN

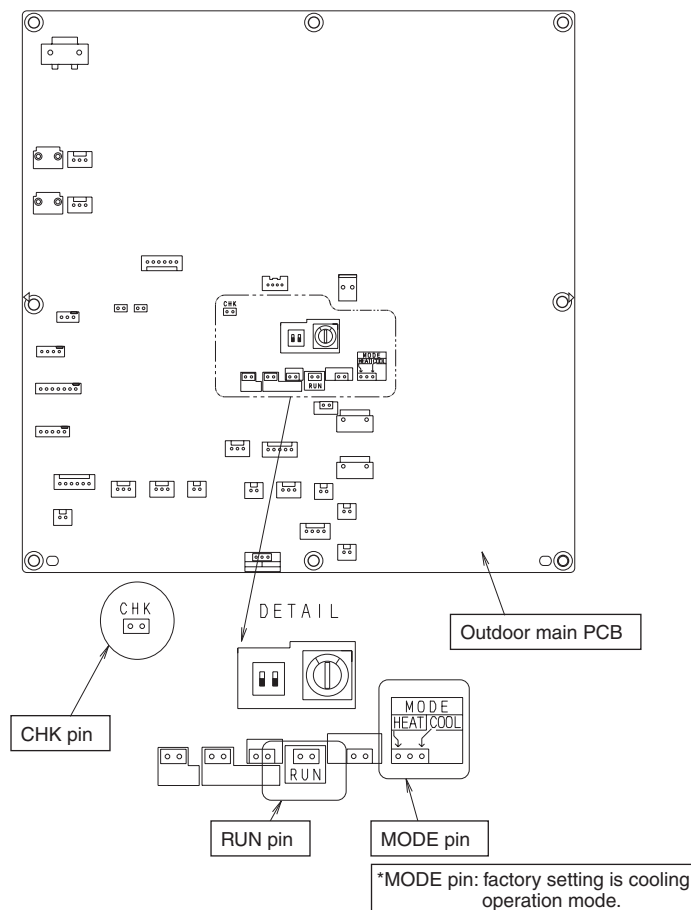

### Check Before Test Run

|  | Content check   |
|--|---|
| Power supply cable<br>Indoor/outdoor connection wire<br>Earth wire | <ul style="list-style-type: none"> <li>● Is the wire set up and connected as described in the instructions? Check for any phase sequence.</li> <li>● Are the wire connection's screws loose?</li> <li>● Is the open and close device / leakage breaker installed?</li> <li>● Is the power supply cable's thickness and length appropriately measured as described in the instructions?</li> <li>● Is it earthed (grounded)?</li> <li>● Check that the insulation resistant value is more than 1 MΩ.<br/>Use the 500 V mega-testers to measure the insulation.<br/>Do not use the mega-tester for any other circuit except for voltage of 220V to 240V or 380-415V.</li> <li>● Are the wire connections for the indoor/outdoor units connected as described in the instructions? Are there any looped wires?</li> <li>● Was the "N-phase" surely connected when connecting the power supply wire on the three-phase model?<br/>If N-phase is not connected, only the fan may repeat turning ON/OFF without the compressor operating. In that case, check if there is any problem with N-phase connection.</li> </ul> |
| Refrigerant pipe   | <ul style="list-style-type: none"> <li>● Is the piping installed as described in the instructions?</li> <li>● Are the pipes sizes appropriate?</li> <li>● Does the pipe's length adhere to the specifications?</li> <li>● Is the branch pipe slant being appropriately done as described in the instructions?</li> <li>● Was vacuum removal sufficiently carried out?</li> <li>● Was the leak tightness test carried out with nitrogen gas? Use the testing pressure of 4.15 MPa.</li> <li>● Is the piping insulation material appropriately installed?<br/>(Insulation material is necessary for both gas and liquid piping.)</li> <li>● Is the 3-way valve for the liquid side and gas side open?</li> </ul>  |

- Always be sure to use a properly insulated tool to operate the short-circuit pin on the circuit board. (Do not use your finger.)
- Never switch the power supply ON until the installation has completed.
- Supply electrical current through all indoor units and check the voltage.
- Supply electrical current through all the outdoor units and check each inter-phase voltage.
- Before the test run, ensure to check that the 3-way valve is open. Operating while the valve is closed causes the compressor to fail.

### Test Run Procedure

- If there are duplicated system addresses, or if the settings for the Nos. of the indoor units are not consistent, an alarm will occur and the system will not start.
- Switch the power supply ON both indoor and outdoor units.
- Short-circuit CHK pin on the outdoor main PCB.  
Do not remove CHK pin until test run is completed.  
Removing CHK pin stops test run.
- Short-circuit RUN pin on the outdoor main PCB for one second or longer.  
Factory setting is cooling operation mode and cooling operation test run starts.  
If heating operation starts, short-circuit both right side and centre of the MODE pin (centre and COOL) continuously.
- Ensure to conduct a test run. In addition, be sure to run the cooling operation test run for at least 20 minutes before starting the heating operation test run.
- To conduct heating operation test run, short-circuit left side and centre of the MODE pin (centre and HEAT) continuously.
- Removing CHK pin's and MODE pin's short-circuit stops test run.
- For the test run using remote control unit, please see installation manual included with the remote control unit.

## 2-15. CHECKS AFTER INSTALLATION HAVE COMPLETED

- Check the following items after completing installation.
  - Is there a short circuit with the intake air flow?
  - Is the insulation secure? (Refrigerant piping)
  - Are there any errors with the wiring?
  - Are the terminal screws loose? Tightening torque (Unit: N•m {kgf•m})  
M4... 1.57 - 1.96 {0.16 - 0.2}, M5... 1.96 - 2.45 {0.2 - 0.25}.
  - Is the drain water flowing smoothly?
  - Is the insulation material properly installed?
  - Is the earth wire securely connected?
  - Is the front panel and the indoor unit air conditioner firmly fixed and was the installation completed without any leakage from the refrigerant?
  - Are the indoor and outdoor units secured firmly installed with bolts at secured locations?

## 2-16. REGARDING DELIVERY TO THE CUSTOMER

- Request the customer to review the instruction manual and explain the operating method for the product.
- In addition, it is also recommended that regular inspection checks are agreed upon for maintenance.

#### 4-1. Room Temperature Control

- The body sensor or remote controller sensor detects temperature in the room. The detected temperature is called the room temperature. The body sensor is the one contained in the indoor unit.

|                          |   |  |
|--------------------------|---|--|
|                          | Body sensor is enabled                            | Remote controller sensor is enabled        |
| Set temp.                | Set temp. in remote controller                    | Set temp. in remote controller             |
| Detected temp. by sensor | Detected temp. by body sensor                     | Detected temp. by remote controller sensor |
| Room temp.               | Detected temp. by body sensor - *correction temp. | Detected temp. by remote controller sensor |

- The thermostat is turned ON or OFF according to the following  $\Delta T$ .

|                      |  |
|----------------------|--|
| $\Delta T$ (Cooling) | $\Delta T = \text{room temp.} - \text{set temp. (set temp. in remote controller)}$ |
| $\Delta T$ (Heating) | $\Delta T = \text{set temp.} - \text{room temp.}$                                  |

※ Correction temperature (only during heating)

If the indoor unit is installed on the ceiling, temperature near the ceiling is higher than near the floor. When the body sensor is enabled, lower temperature near the floor must be considered. To correct this difference in temperature, the correction temperature is used.

The factory setting for the correction temperature is different depending on the model. Refer to “4-11. Parameter”.

Example: Cooling temperature correction

4-Way Cassette (correction temperature: 0 degrees)

Body sensor is enabled

|  |                 |                 |                 |
|--|-----------------|-----------------|-----------------|
| Set temp. in remote controller             | 28°C            | 28°C            | 28°C            |
| Detected temp. by sensor                   | 30.0°C          | 27.5°C          | 27.0°C          |
| Detected temp. by body sensor              | 30.0°C          | 27.5°C          | 27.0°C          |
| Detected temp. by remote controller sensor | 30.0°C          | 27.5°C          | 27.0°C          |
| Room temp. = temp. detected by body sensor | 30.0°C<br>=30.0 | 27.5°C<br>=27.5 | 27.0°C<br>=27.0 |
| $\Delta T$                                 | +2.0deg         | -0.5deg         | -1.0deg         |
|  | Thermostat ON   | Thermostat ON   | Thermostat OFF  |

Example: Heating temperature correction

4-Way Cassette (correction temperature: 4 degrees)

Body sensor is enabled

|  |                       |                       |                       |
|--|-----------------------|-----------------------|-----------------------|
| Set temp. in remote controller                     | 20°C                  | 20°C                  | 20°C                  |
| Detected temp. by sensor                           | 17.0°C                | 22.0°C                | 25.0°C                |
| Detected temp. by body sensor                      | 17.0°C                | 22.0°C                | 25.0°C                |
| Detected temp. by remote controller sensor         | 13.0°C                | 18.0°C                | 21.0°C                |
| Room temp. = temp. detected by body sensor – 4 deg | 13.0°C<br>=17.0-4 deg | 18.0°C<br>=22.0-4 deg | 21.0°C<br>=25.0-4 deg |
| $\Delta T$   | +7.0deg               | +2.0deg               | -1.0deg               |
|  | Thermostat ON         | Thermostat ON         | Thermostat OFF        |

Remote controller sensor is enabled

|   |               |                |                |
|---|---------------|----------------|----------------|

|   | Thermostat ON | Thermostat OFF | Thermostat OFF |

Remote controller sensor is enabled

|   |               |                |                |
|---|---------------|----------------|----------------|
| Set temp. in remote controller                          | 20°C          | 20°C           | 20°C           |
| Detected temp. by sensor                                | 17.0°C        | 20.5°C         | 21.0°C         |
| Detected temp. by body sensor                           | 21.0°C        | 24.5°C         | 25.0°C         |
| Detected temp. by remote controller sensor              | 17.0°C        | 20.5°C         | 21.0°C         |
| Room temp. = temp. detected by remote controller sensor | 17.0°C =17.0  | 20.5°C =20.5   | 21.0°C =21.0   |
| $\Delta T$  | +3.0deg       | -0.5deg        | -1.0deg        |
|   | Thermostat ON | Thermostat OFF | Thermostat OFF |

Body sensor is enabled

Remote controller sensor is enabled

- ① The thermostat does not turn OFF for 3 minutes after it turns ON.
- ② The thermostat does not turn ON 1 to 3 minutes after it turns OFF.
- ③ The thermostat does not turn OFF for 60 minutes during the test run mode. (Forced thermostat ON)  
\*However, the thermostat turns OFF if an alarm occurs.

**4-2. Heating Standby**

● In heating mode, the indoor fan speed decreases to prevent cold air discharge from the indoor unit. During this time, (heating standby) is displayed on the remote controller.

① This condition occurs in the following cases.

- Thermostat OFF
  - Defrosting operation
  - Indoor heat exchanger liquid temperature (E1) < 28°C and discharge air temperature < 25°C just after heating operation started
- The fan speed may sometimes increase when this condition continues for 6 minutes.

② The fan mode increases when the heat exchanger liquid temperature (E1) or discharge air temperature increases.

※ The fan mode is selected based on the discharge air temperature and E1 temperature as shown in the below figure. If the E1 temperature and discharge air temperature are different, the higher temperature is used.

※ The function of “HH” is identical to the automatic fan speed mode.

### 4-3. Automatic Fan Speed Control

- ① The indoor fan mode is controlled as shown below during the automatic fan mode.
- ② The fan mode does not change for 3 minutes during cooling operation and 1 minute during heating operation once it is changed.
- ③ The values in the parenthesis are when the remote controller sensor is enabled.

#### 4-4. Drain Pump Control

The drain pump operates in the following conditions.

- ① Cooling thermostat ON
- ② The float switch worked.
- ③ The drain pump may often operate for a while when the cooling thermostat turns OFF or the indoor unit is stopped.
- ④ The drain pump can be turned on when the cooling thermostat is OFF if the setting is made to prevent water collected in the drain pan for a long time. For details, refer to “7-3. Detailed Settings Function.”
- ⑤ The indoor unit heat exchanger liquid temperature (E1) is less than 0°C when the cooling thermostat is OFF or the indoor unit is stopped.

※ The drain pump operates for 20 minutes once it starts operating.

**4-5. Automatic Heating/Cooling Control**

- ① The operating mode is selected according to the set temperature and room temperature when the operation is started.  
 Room temperature  $\geq$  set temperature in remote controller  $- 1^{\circ}\text{C} \rightarrow$  Cooling mode  
 Room temperature  $<$  set temperature in remote controller  $- 1^{\circ}\text{C} \rightarrow$  Heating mode
- ② The set temperature is corrected according to the operating mode. The correction temperature is +2 degrees in cooling mode and -2 degrees in heating mode at the time of factory shipment.  
 ※ The correction value is different depending on the model. Refer to “4-11. Parameter” for details.  
 Corrected cooling temperature – control temperature for cooling  
 Corrected heating temperature – control temperature for heating

When setting temperature in remote controller is  $20^{\circ}\text{C}$  in the cooling mode (at shipment) :

|                                |                      |
|--------------------------------|----------------------|
| Control temp. for cooling      | $22^{\circ}\text{C}$ |
| Set temp. in remote controller | $20^{\circ}\text{C}$ |
| Control temp. for heating      | $18^{\circ}\text{C}$ |

- ③ Condition for mode change  
 Heating  $\rightarrow$  Cooling: Room temperature  $\geq$  Control temperature for cooling  $+ 0.5$  degree  
 Cooling  $\rightarrow$  Heating: Room temperature  $\leq$  Control temperature for heating  $-1.0$  degree

When setting temperature in remote controller is  $20^{\circ}\text{C}$  in the cooling mode :

For settings at the time of factory shipment, refer to “4-11. Parameter”.

#### 4-6. Automatic Flap Control

- The flap position can be selected from 5 positions.

Except ceiling type (T2 type)

For ceiling type (T2 type)

| Operating mode | Flap position       |
|----------------|---------------------|
| Cooling/Dry    | 1 · 2 · 3 · 4* · 5* |
| Fan            | 1 · 2 · 3 · 4 · 5   |
| Heating        | 1 · 2 · 3 · 4 · 5   |

\* Only U2

- ① The flap will be closed automatically when the indoor unit is stopped.  
Close: Types K1, T2, U2, Y2
- ② The flap closes once and moves to the set position when the operating mode is changed.  
The flap for the ceiling type (T2), however, moves to the set position directly without closing when the operating mode is changed.

**NOTE**

Do not change the flap position manually.

- ※ Only the swing operation can be used.
- ※ The swing operation can be set for the flap.

#### 4-7. Filter Sign

- ① When accumulated operating time of the indoor unit reaches the set time, the filter sign appears on the remote controller. Clean the filter.  
Refer to “7-2. List of Simple Setting Items, 7-5. Simple setting items and Filter sign ON times for each model”.
- ② After cleaning the filter, press the filter button on the remote controller once. The filter sign turns off.

#### 4-8. Fan Control during Dry Mode

The fan control during dry mode is as follows.

A: Fan mode set in the remote controller

B: Fan mode is L during thermostat ON, LL during thermostat OFF

※ For details on  $\Delta T$ , refer to “4-1. Room Temperature Control”.

#### 4-9. Ventilation Fan Output

- The output of ventilation turns ON when the indoor unit turns ON. Also, when the indoor unit turns OFF, the output of the ventilation turns OFF.
- The ventilation fan can also be turned ON and OFF using the ventilation button on the remote controller.

Refer to the operating instructions supplied with the remote controller.

To enable this function, set the indoor EEPROM DN31 to “0001” in advance.

#### 4-10. T10 Terminal

Using the T10 terminal, each indoor unit can be operated or stopped separately. Also, operating condition can be checked.

4-11. Parameter

| Type | Model                 | Correction temp. (heating)          | Heat/cool switching correction temp. (automatic heat/cool) |
|------|-----------------------|-------------------------------------|--|
|      |                       | Setting at time of factory shipment | Setting at time of factory shipment                        |
| U2   | 4-Way Cassette        | 4 deg                               | 2 deg  |
| Y2   | 4-Way Cassette 60x60  | 4 deg                               | 2 deg  |
| T2   | Ceiling               | 4 deg                               | 2 deg  |
| K1   | Wall Mounted          | 2 deg                               | 2 deg  |
| F1   | Low Silhouette Ducted | 4 deg                               | 2 deg  |
| N1   | Ducted                | 4 deg                               | 2 deg  |

**4-12. Control Functions**

- **PE** Single-phase : U-36PE2E5A, 50PE2E5A, 60PE2E5A
- **PEY** Single-phase : U-60PEY2E5, 71PEY2E5

**4-12-1. Indoor Air Temperature Control**

The thermostat is switched on and off in accordance with  $\Delta T$  shown below.

|  |  |
|--|--|
| $\Delta T = (\text{Indoor air temperature}) - (\text{Temperature set with the remote controller})$ |  |
| In the body thermostat mode (setting at factory shipment)  | Indoor air temperature = (Body sensor) - (Shift temperature *) |
| In the remote controller thermostat mode   | Indoor air temperature = (Remote controller sensor)            |

**\* Shift Temperature**

Only valid during heating operation. Set at 0 °C during cooling operation.

The settings at factory shipment during heating operation are as follows:

- Wall Mounted type : 2°C
- Floor Standing type : 0°C
- All other types (4-way types, Concealed types, etc.) : 4°C

This function acts as the coefficient for adjusting differences in temperature caused by the height of the living space from the floor to the ceiling (the temperature at ceiling height is higher) during heating operation. The setting can be modified between 0°C and 6°C with mode [06] (Simple Settings Function) on the remote controller.

- (1) Once the thermostat has been switched on, it cannot be switched off again by indoor air temperature control for a period of 10 minutes.
- (2) Once the thermostat has been switched off, it cannot be switched on again for a period of 3 minutes.
- (3) When in the test run operation mode, the thermostat will not be switched off by indoor air temperature control and the operation will continue.

**4-12-2. Compressor Frequency Control**

The frequency of the compressor's inverter is limited by either of the following controls depending on whether the cooling or heating mode is in operation.

**Cooling Mode :**

- Indoor air temperature control
- Maximum and minimum frequency control
- Current release control
- Cooling high-load prevention control
- Cooling freeze prevention control
- Discharge temperature control

**Heating Mode :**

- Indoor air temperature control
- Maximum and minimum frequency control
- Current release control
- Heating high-load prevention control
- Discharge temperature control

## 1) Indoor Air Temperature Control

By the control method, not only the thermostat is switched on and off, as explained section "4-12-1. Indoor Air Temperature Control", but also the frequency of the compressor's inverter is controlled in accordance with  $\Delta T$  and fluctuations in indoor air temperature. Inverter frequency is controlled as follows:

|  |   |
|--|---|
| When $\Delta T$ is high (not yet reached the temperature set with the remote controller).                                  | Controlled so that the inverter frequency is increased.         |
| When $\Delta T$ is low (approximately +1.0 or less in the cooling mode or approximately -1.0 or more in the heating mode). | Controlled so that the inverter frequency is decreased or kept. |
| When the indoor air temperature is rising in the cooling mode and dropping in the heating mode.                            | Controlled so that the inverter frequency is increased.         |
| When the indoor air temperature is dropping in the cooling mode and rising in the heating mode.                            | Controlled so that the inverter frequency is decreased.         |

\* The fluctuations of the compressor inverter frequency adjustments are calculated taking into account not only  $\Delta T$ , but also fluctuations in indoor air temperature.

## 2) Maximum and Minimum Frequency Control

The compressor's inverter frequency is controlled in accordance with the model and operation mode. The maximum and minimum frequencies for each model are shown in the table below.

\* There are cases in which frequency is limited with other control functions depending on operational conditions, so operations are not always carried out in accordance with the maximum frequencies listed below.

· Maximum and Minimum Frequency

|                        |         | PE       |          |          | PEY      |          |
|------------------------|---------|----------|----------|----------|----------|----------|
|                        |         | 36PE2E5A | 50PE2E5A | 60PE2E5A | 60PEY2E5 | 71PEY2E5 |
| Maximum Frequency (Hz) | Cooling | 75       | 80       | 90       | 90       | 98       |
|                        | Heating | 80       | 95       | 115      | 115      | 115      |
| Minimum Frequency (Hz) | Cooling | 14       | 14       | 14       | 14       | 14       |
|                        | Heating | 15       | 15       | 15       | 15       | 15       |

\* There is a case in which the frequency is set at 24.0Hz to protect the compressor in accordance with ambient temperature and indoor loads.

## 3) Current Release Control

The inverter frequency is controlled so that the current value for the inverter compressor is less than the figure listed in the table below in order to prevent abnormal increases in the inverter circuit located within the outdoor unit's electrical box.

Current release control with primary current : The limited values are modified in accordance with ambient temperature.

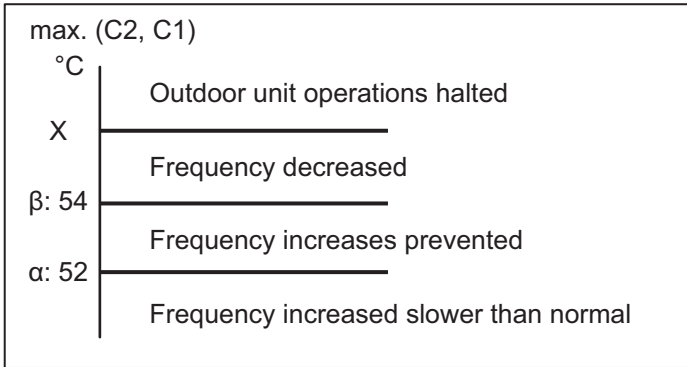

|        |         | PE       |          |          | PEY      |          |
|--------|---------|----------|----------|----------|----------|----------|
|        |         | 36PE2E5A | 50PE2E5A | 60PE2E5A | 60PEY2E5 | 71PEY2E5 |
| Is (A) | Cooling | 9.5      | 9.5      | 13.2     | 13.2     | 13.2     |
|        | Heating | 11       | 12       | 16.5     | 16.5     | 16.5     |

#### 4) Condensation Temperature Control (cooling)

This system control is performed to limit the inverter frequency in order to restrict high pressure's abnormal increase and high-load operating prevention in the cooling mode.

In accordance with the temperature of the outdoor heat exchanger temperature sensors (C1, C2), such controls are performed as to halting the operations of the indoor unit, decreasing the inverter frequency and restricting its increase, etc.

- (a) The threshold value is decreased in accordance with the compressor frequency or indoor load (differences of temperature).
- (b) When "X" values are lowered, the results basically become  $\beta=X-2$ ,  $\alpha=X-3$ .

Outdoor EEPROM : Amendment of X values can be made due to 4B.

EEPROM setting in outdoor unit  
CODE: 4B

| Setting No. | -2 | -1   | 0    | 1 *1 |
|-------------|----|------|------|------|
| X (°C)      | 52 | 56.5 | 58.5 | 60   |

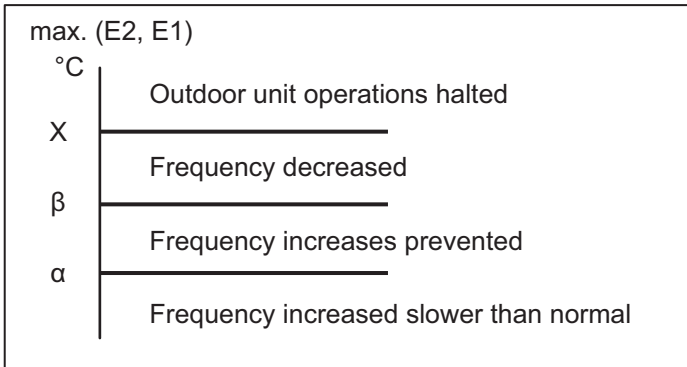

\*1 Setting at factory shipment

#### 5) Condensation Temperature Control (heating)

This system control is performed to limit the inverter frequency in order to restrict high pressure's abnormal increase and high-load operating prevention in the heating mode.

In accordance with the temperature of the indoor heat exchanger temperatures sensor (E1, E2), such controls are performed as to halting the operations of the indoor unit, decreasing the inverter frequency and restricting its increase, etc.

- (a) The threshold value is decreased in accordance with the compressor frequency or indoor load (differences of temperature).
- (b) When "X" values are lowered, the results basically become  $\beta=X-2$ ,  $\alpha=X-3$ .

Outdoor EEPROM : Amendment of X values can be made due to 4B.

EEPROM setting in outdoor unit  
CODE: 4B

| Setting No. | -2 | -1   | 0    | 1 *1 |
|-------------|----|------|------|------|
| X (°C)      | 52 | 56.5 | 58.5 | 60   |

\*1 Setting at factory shipment

|          | U-36PE2E5A<br>U-50PE2E5A | U-60PE2E5A<br>U-60PEY2E5, U-71PEY2E5 |
|----------|--------------------------|--------------------------------------|
| $\beta$  | 51                       | 52                                   |
| $\alpha$ | 47                       | 48                                   |

## 6) Cooling Freeze Prevention Control

The following control is performed during cooling operations (including dry mode operation), in accordance with whichever of the indoor heat exchanger temperatures (E1 or E2) is lower. (See the chart below.)

- (a) Frequency will not be decreased less than 6 minutes after thermostat ON.
- (b) The threshold value is increased in accordance with the indoor load (differences of temperature).

Outdoor EEPROM : Amendment of  $\alpha$  and  $\beta$  values can be made due to 3F or 40.

EEPROM setting in outdoor unit

CODE: 3F (for  $\alpha$  setting)

|             |     |       |     |       |   |
|-------------|-----|-------|-----|-------|---|
| Setting No. | -15 | ..... | 0 * | ..... | 9 |
| $\alpha$    | -15 |       | 0   |       | 9 |

CODE: 40 (for  $\beta$  setting)

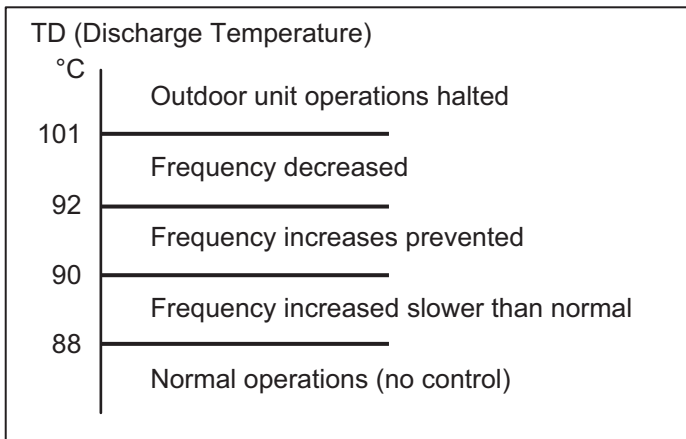

|             |     |       |     |       |   |
|-------------|-----|-------|-----|-------|---|
| Setting No. | -15 | ..... | 0 * | ..... | 9 |
| $\beta$     | -15 |       | 0   |       | 9 |

\* Setting at factory shipment

## 7) Discharge Temperature Control

The following control is performed to prevent the discharge temperature from rising abnormally in order to protect the inverter compressor.

In accordance with the temperature of the discharge sensor TD, such controls are performed as to limiting the increase of inverter frequency, decreasing it or halting operation of the compressor.

\* If the discharge temperature exceeds 101°C, operations of the compressor are halted and restarted after 3 minutes.

If this start/stop activity is repeated 5 times, the alarm "P03" (abnormal discharge temperature) occurs.

## 8) Defrosting Control

This control function removes frost that has adhered to the outdoor heat exchanger during the heating operation. The control is performed to prevent the deterioration of the heating capabilities attributed to the adherence of frost, and to prevent the crack or crush of pipes attributed to the accretion of ice. The following control is performed in accordance with the ambient temperature and the outdoor heat exchanger temperature sensor (C1).

### Overall Flow Chart of Defrosting Control

#### ① Frost adherence detection

- If the following conditions are satisfied during heating operations, it is regarded as "frost adherence is detected".
- Frost adherence detection is performed in accordance with the ambient temperature (TO) and the outdoor heat exchanger temperature sensor (C1).
- Frost adherence detection conditions
  - (a) Following satisfied condition is detected for accumulation of 60 minutes.  
Outdoor heat exchanger temperature sensor (C1)  $\leq$  L1
  - (b) Following satisfied condition is detected for consecutive 2 minutes or more, 2 times.  
Outdoor heat exchanger temperature sensor (C1)  $\leq$  L2

- (c) Following satisfied condition is detected for accumulation of over 90 minutes.  
Outdoor heat exchanger temperature sensor (C1)  $<$  -3 °C

#### ② Heating Mask Time

This refers to the shortest time that heating operations must be performed without defrosting operations being executed. The mask time for this model is 25 minutes.

- \* Defrosting operations will not be commenced until the defrosting mask time has elapsed, even if frost adherence has been detected.

### ③ Ending Defrosting

Defrosting operations are ended when the following conditions are satisfied.

- Ending defrosting conditions
  - (a) When the temperature of the outdoor heat exchanger temperature sensor (C1) is 8°C or higher.
  - (b) When the temperature of the outdoor heat exchanger temperature sensor (C1) is 6°C or higher for consecutive 60 seconds.
  - (c) When a maximum of 15 minutes defrosting time has elapsed.

### 9) Outdoor Unit Fan Control

The appropriate rotations per minute for the outdoor unit fan are determined in accordance with the ambient temperature and the frequency of the compressor inverter.

The outdoor unit fan step is controlled between a range of W1 (Step 1) and WF (Step 15).

### 10) Outdoor Unit's Electrical Expansion Valve Control

The electrical expansion valve controls the amount of refrigerant that is allowed to flow in accordance with the operation status.

The valve is adjusted in accordance with the discharge temperature (TD), the outdoor heat exchanger temperature sensor (C1 and C2), the suction temperature sensor (TS), and the indoor unit's heat exchanger temperature sensors (E1).

#### (1) Cooling Mode

Controlled so that the suction temperature (TS) - indoor heat exchanger temperature (E1) is between 0 degree and 2 degrees under normal conditions.

There are cases where the aperture opens wider than normal operation if the discharge temperature increases.

#### (2) Heating Mode

Controlled so that the suction temperature (TS) - outdoor heat exchanger temperature minimum (C1 and C2) is between 0 degree and 2 degrees under normal conditions.

There are cases where the aperture opens wider than normal operation if the discharge temperature increases.

### 11) Demand Control

#### U-36PE2E5A, U-50PE2E5A, U-60PE2E5A

Demand control can be operated by using a wired remote controller. (model CZ-RTC5A)

The setting of current control values during demand operation can be made in 5% increments between 40% and 100% rated current by using a wired remote controller. (model CZ-RTC5A)

- **PE** Single-phase : U-71PE1E5A, 100PE1E5A, 125PE1E5A, 140PE1E5A
- **PE** 3-phase : U-71PE1E8A, 100PE1E8A, 125PE1E8A, 140PE1E8A
- **PEY** Single-phase : U-100PEY1E5, 125PEY1E5
- **PEY** 3-phase : U-100PEY1E8, 125PEY1E8, 140PEY1E8

### 4-12-3. Indoor Air Temperature Control

The thermostat is switched on and off in accordance with  $\Delta T$  shown below.

|  |  |
|--|--|
| $\Delta T = (\text{Indoor air temperature}) - (\text{Temperature set with the remote controller})$ |  |
| In the body thermostat mode<br>(setting at factory shipment)                                       | Indoor air temperature = (Body sensor) - (Shift temperature *) |
| In the remote controller thermostat mode   | Indoor air temperature = (Remote controller sensor)            |

\* Shift Temperature

Only valid during heating operation. Set at 0 °C during cooling operation.

The settings at factory shipment during heating operation are as follows:

Wall Mounted type : 2°C

Floor Standing type : 0°C

All other types (4-way types, Concealed types, etc.) : 4°C

This function acts as the coefficient for adjusting differences in temperature caused by the height of the living space from the floor to the ceiling (the temperature at ceiling height is higher) during heating operation.

The setting can be modified between 0°C and 6°C with mode [06] (Simple Settings Function) on the remote controller.

- (1) Once the thermostat has been switched on, it cannot be switched off again by indoor air temperature control for a period of 10 minutes.
- (2) Once the thermostat has been switched off, it cannot be switched on again for a period of 3 minutes.
- (3) When in the test run operation mode, the thermostat will not be switched off by indoor air temperature control and the operation will continue.

### 4-12-4. Compressor Frequency Control

The frequency of the compressor's inverter is limited by either of the following controls depending on whether the cooling or heating mode is in operation.

**Cooling Mode :**

- Indoor air temperature control
- Maximum and minimum frequency control
- Current release control
- Cooling high-load prevention control
- Cooling freeze prevention control
- Discharge temperature control

**Heating Mode :**

- Indoor air temperature control
- Maximum and minimum frequency control
- Current release control
- Heating high-load prevention control
- Discharge temperature control

### 1) Indoor Air Temperature Control

By the control method, not only the thermostat is switched on and off, as explained section “4-12-3. Indoor Air Temperature Control”, but also the frequency of the compressor's inverter is controlled in accordance with  $\Delta T$  and fluctuations in indoor air temperature. Inverter frequency is controlled as follows:

|  |   |
|--|---|
| When $\Delta T$ is high (not yet reached the temperature set with the remote controller).                                  | Controlled so that the inverter frequency is increased.         |
| When $\Delta T$ is low (approximately +1.0 or less in the cooling mode or approximately -1.0 or more in the heating mode). | Controlled so that the inverter frequency is decreased or kept. |

### 2) Maximum and Minimum Frequency Control

The compressor's inverter frequency is controlled in accordance with the model and operation mode. The maximum and minimum frequencies for each model are shown in the table below.

\* There are cases in which frequency is limited with other control functions depending on operational conditions, so operations are not always carried out in accordance with the maximum frequencies listed below.

· Maximum and Minimum Frequency

|                        |         | PE                   |                        |                        |                        | PEY                    |                        |           |  |
|------------------------|---------|----------------------|------------------------|------------------------|------------------------|------------------------|------------------------|-----------|--|
|                        |         | 71PE1E5A<br>71PE1E8A | 100PE1E5A<br>100PE1E8A | 125PE1E5A<br>125PE1E8A | 140PE1E5A<br>140PE1E8A | 100PEY1E5<br>100PEY1E8 | 125PEY1E5<br>125PEY1E8 | 140PEY1E8 |  |
| Maximum Frequency (Hz) | Cooling | 70.0                 | 55.0                   | 65.0                   | 75.0                   | 85.0                   | 75.0                   | 75.0      |  |
|                        | Heating | 85.0                 | 93.0                   | 95.0                   | 99.0                   | 115.0                  | 95.0                   | 95.0      |  |
| Minimum Frequency (Hz) | Cooling | 15.0                 | 15.0                   | 15.0                   | 15.0                   | 15.0                   | 15.0                   | 15.0      |  |
|                        | Heating | 15.0                 | 15.0                   | 15.0                   | 15.0                   | 15.0                   | 15.0                   | 15.0      |  |

\* There is a case in which the frequency set at maximum and minimum may sometimes decrease in accordance with ambient temperature and indoor loads.

### 3) Current Release Control

The inverter frequency is controlled so that the current value for the inverter compressor is less than the figure listed in the table below in order to prevent abnormal increases in the inverter circuit located within the outdoor unit's electrical box.

Current release control with primary current : The limited values are modified in accordance with ambient temperature.

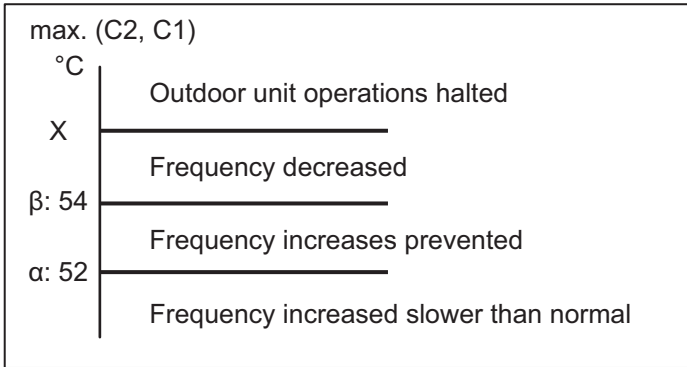

|        |         | PE       |           |           |           | PEY       |           |           |
|--------|---------|----------|-----------|-----------|-----------|-----------|-----------|-----------|
|        |         | 71PE1E5A | 100PE1E5A | 125PE1E5A | 140PE1E5A | 100PEY1E5 | 125PEY1E5 | —         |
| Is (A) | Cooling | 14.5     | 24.0      | 26.0      | 27.0      | 24.0      | 27.0      | —         |
|        | Heating | 18.0     | 24.0      | 26.0      | 28.0      | 24.0      | 27.0      | —         |
|        |         | 71PE1E8A | 100PE1E8A | 125PE1E8A | 140PE1E8A | 100PEY1E8 | 125PEY1E8 | 140PEY1E8 |
| Is (A) | Cooling | 6.0      | 8.0       | 8.6       | 9.0       | 8.0       | 9.0       | 9.0       |
|        | Heating | 7.0      | 8.5       | 9.5       | 10.5      | 8.5       | 9.5       | 9.5       |

#### 4) Condensation Temperature Control (cooling)

This system control is performed to limit the inverter frequency in order to restrict high pressure's abnormal increase and high-load operating prevention in the cooling mode.

In accordance with the temperature of the outdoor heat exchanger temperature sensors (C1, C2), such controls are performed as to halting the operations of the indoor unit, decreasing the inverter frequency and restricting its increase, etc.

- (a) The threshold value is decreased in accordance with the compressor frequency or indoor load (differences of temperature).
- (b) When "X" values are lowered, the results basically become  $\beta=X-2$ ,  $\alpha=X-3$ .

Outdoor EEPROM : Amendment of X values can be made due to 4B.

EEPROM setting in outdoor unit  
CODE: 4B

| Setting No. | -2 | -1   | 0    | 1 *1 |
|-------------|----|------|------|------|
| X (°C)      | 52 | 56.5 | 58.5 | 60   |

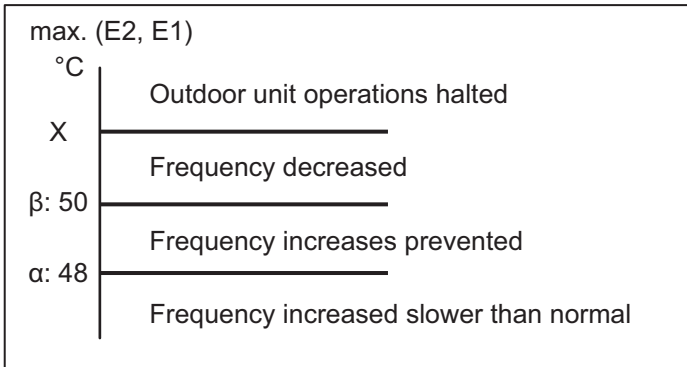

\*1 Setting at factory shipment

#### 5) Condensation Temperature Control (heating)

This system control is performed to limit the inverter frequency in order to restrict high pressure's abnormal increase and high-load operating prevention in the heating mode.

In accordance with the temperature of the indoor heat exchanger temperatures sensor (E1, E2), such controls are performed as to halting the operations of the indoor unit, decreasing the inverter frequency and restricting its increase, etc.

- (a) The threshold value is decreased in accordance with the compressor frequency or indoor load (differences of temperature).
- (b) When "X" values are lowered, the results basically become  $\beta=X-2$ ,  $\alpha=X-3$ .

Outdoor EEPROM : Amendment of X values can be made due to 4B.

EEPROM setting in outdoor unit  
CODE: 4B

| Setting No. | -2 | -1   | 0    | 1 *1 |
|-------------|----|------|------|------|
| X (°C)      | 52 | 56.5 | 58.5 | 60   |

\*1 Setting at factory shipment

### 6) Cooling Freeze Prevention Control

The following control is performed during cooling operations (including dry mode operation), in accordance with whichever of the indoor heat exchanger temperatures (E1 or E2) is lower. (See the chart below.)

- (a) Frequency will not be decreased less than 6 minutes after thermostat ON.
- (b) The threshold value is increased in accordance with the indoor load (differences of temperature).

Outdoor EEPROM : Amendment of  $\alpha$  and  $\beta$  values can be made due to 3F or 40.

EEPROM setting in outdoor unit

CODE: 3F (for  $\alpha$  setting)

|             |     |       |     |       |   |
|-------------|-----|-------|-----|-------|---|
| Setting No. | -15 | ..... | 0 * | ..... | 9 |
| $\alpha$    | -15 |       | 0   |       | 9 |

CODE: 40 (for  $\beta$  setting)

|             |     |       |     |       |   |
|-------------|-----|-------|-----|-------|---|
| Setting No. | -15 | ..... | 0 * | ..... | 9 |
| $\beta$     | -15 |       | 0   |       | 9 |

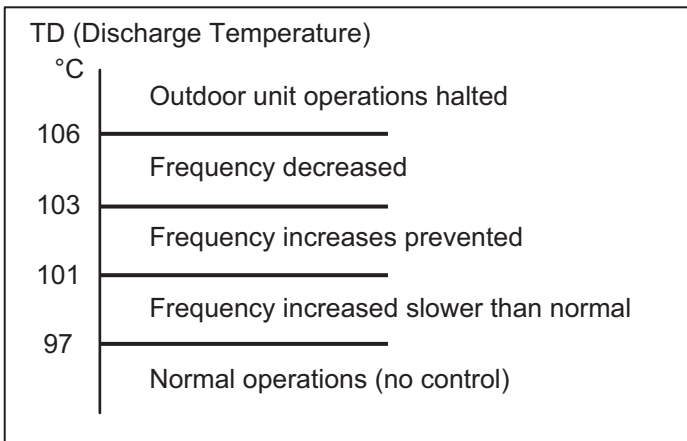

\* Setting at factory shipment

4

### 7) Discharge Temperature Control

The following control is performed to prevent the discharge temperature from rising abnormally in order to protect the inverter compressor.

In accordance with the temperature of the discharge sensor TD, such controls are performed as to limiting the increase of inverter frequency, decreasing it or halting operation of the compressor.

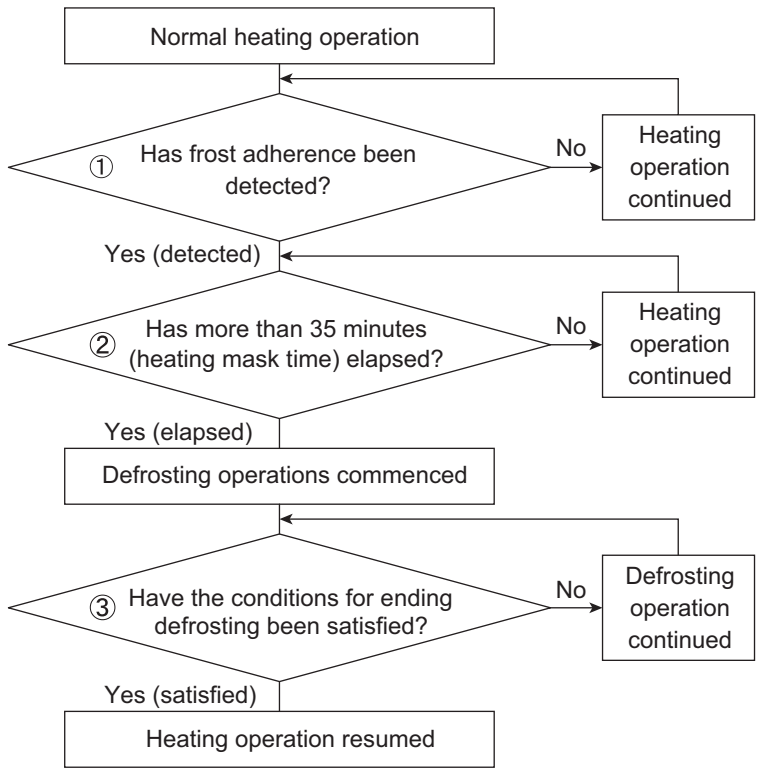

\* If the discharge temperature exceeds 106°C, operations of the compressor are halted and restarted after 3 minutes.

If this start/stop activity is repeated 5 times, the alarm "P03" (abnormal discharge temperature) occurs.

### 8) Defrosting Control

This control function removes frost that has adhered to the outdoor heat exchanger during the heating operation. The control is performed to prevent the deterioration of the heating capabilities attributed to the adherence of frost, and to prevent the crack or crush of pipes attributed to the accretion of ice. The following control is performed in accordance with the ambient temperature and the outdoor heat exchanger temperature sensor (C1).

#### Overall Flow Chart of Defrosting Control

① Frost adherence detection

- If the following conditions are satisfied during heating operations, it is regarded as "frost adherence is detected".
- Frost adherence detection is performed in accordance with the ambient temperature (TO) and the outdoor heat exchanger temperature sensor (C1).
- Frost adherence detection conditions
  - (a) Following satisfied condition is detected for accumulation of 60 minutes.  
Outdoor heat exchanger temperature sensor (C1) ≤ L1
  - (b) Following satisfied condition is detected for consecutive 4 minutes or more, 2 times.  
Outdoor heat exchanger temperature sensor (C1) ≤ L2

- (c) Following satisfied condition is detected for accumulation of over 90 minutes.  
Outdoor heat exchanger temperature sensor (C1) < -3 °C

② Heating Mask Time

This refers to the shortest time that heating operations must be performed without defrosting operations being executed. The mask time for this model is 35 minutes.

\* Defrosting operations will not be commenced until the defrosting mask time has elapsed, even if frost adherence has been detected.

### ③ Ending Defrosting

Defrosting operations are ended when the following conditions are satisfied.

- Ending defrosting conditions
  - (a) When the temperature of the outdoor heat exchanger temperature sensor (C1) is 12°C or higher.
  - (b) When the temperature of the outdoor heat exchanger temperature sensor (C1) is 10°C or higher for consecutive 60 seconds.
  - (c) When a maximum of 15 minutes defrosting time has elapsed.

## 9) Outdoor Unit Fan Control

The appropriate rotations per minute for the outdoor unit fan are determined in accordance with the ambient temperature and the frequency of the compressor inverter.

The outdoor unit fan step is controlled between a range of W1 (Step 1) and WF (Step 15).

## 10) Outdoor Unit's Electrical Expansion Valve Control

The electrical expansion valve controls the amount of refrigerant that is allowed to flow in accordance with the operation status.

The valve is adjusted in accordance with the discharge temperature (TD), the outdoor heat exchanger temperature sensor (C1), the suction temperature sensor (TS), and the indoor unit's heat exchanger temperature sensors (E1 and E2).

### (1) Cooling Mode

Controlled so that the suction temperature (TS) - indoor heat exchanger temperature minimum (E1 and E2) is between 0 degree and 2 degrees under normal conditions.

There are cases where the aperture opens wider than normal operation if the discharge temperature increases.

### (2) Heating Mode

Controlled so that the suction temperature (TS) - outdoor heat exchanger temperature (C1) is between 0 degree and 2 degrees under normal conditions.

There are cases where the aperture opens wider than normal operation if the discharge temperature increases.

## 11) Demand Control

There are two styles of demand operations available as methods of restraining power consumption.

There is a demand terminal as normal equipment in the outdoor unit.

Demand control can be selected as the following table.

Input current should be DC24V, 10mA

Connecting wiring must be used "shield wiring".

| Short-circuit |         |         | Control (range of operations)                                 |
|---------------|---------|---------|---|
| LV1-COM       | LV2-COM | LV3-COM |   |
| 0             | 0       | 0       | No restricted   |
| 1             | 0       | 0       | Rated current restricted to A% (A% = 75% at factory shipment) |
| 0             | 1       | 0       | Rated current restricted to B% (B% = 50% at factory shipment) |
| 0             | 0       | 1       | Control OFF   |

\* The operational current is restricted to either A% or B% as a general indicator during demand input.

- A% and B% can be amended in calibrations of 5% between 70% and 100% with the outdoor unit's maintenance remote controller.

For details on how to amend the parameters, see the chapter on the outdoor maintenance remote controller, (refer to the section "6-6. Settings Modes : Setting the Outdoor Unit EEPROM").

- A% value amendments: Parameters are amended with item code "1A" (demand 1).
- B% value amendments: Parameters are amended with item code "1B" (demand 2).

|                                  | 26                         | 6                                    | OFF            | ON             |
|                                  | 27                         | 7                                    | OFF            | ON             |
|                                  | 28                         | 8                                    | OFF            | ON             |
|                                  | 29                         | 9                                    | OFF            | ON             |
|                                  | 30                         | 0                                    | ON             | ON             |

## 1-2. Self-Diagnostics Function Table

- Causes and corrections in instances when automatic address setting cannot be started.

| Trouble  | Cause and correction  |
|--|---|
| The power LED on the outdoor unit control PCB does not turn ON.  | Check for any errors in the power wiring to the outdoor unit, and check for a missing phase.  |
| LED 1 and 2 on the outdoor unit control PCB do not turn OFF when the outdoor unit power is turned ON, and automatic address setting cannot be started. | Check the "Alarm Displays" table and correct the problem.   |
| An alarm appears immediately when automatic address setting is started from the remote controller.   |   |
| Nothing happens when the operator attempts to start automatic address setting from the remote controller.  | Check that the remote controller wiring and the inter-unit control wiring are connected correctly.<br>Check that the indoor unit power is ON. |

- Causes and corrections in instances when automatic address setting starts, but cannot be completed successfully.

| Trouble  | Cause and correction   |
|--|--|
| An alarm appears on the remote controller sometime from several seconds to several minutes after automatic address setting is started.   | Check the "Alarm Displays" table and correct the problem.  |
| LED 1 and 2 on the outdoor unit control PCB indicate that automatic address setting is in progress (the LEDs blink alternately) for several minutes after automatic address setting is started (the compressors may also start and stop several times), however LED 1 and 2 never indicate that automatic address setting is completed (turn OFF). | Check the alarm details on the "Outdoor Unit Control PCB LED 1 and 2 Alarms" table, then check the "Alarm Displays" table and correct the problem. |

- If alarm E15, E16, or E20 appears after automatic address setting is started, check the following items.

| Alarm display | Alarm description  |
|---------------|--|
| E15           | The total capacity of indoor units is too lower than that of outdoor unit.   |
| E16           | The total capacity of indoor units is too higher than that of outdoor unit.<br>The number of indoor unit is two or more.     |
| E20           | The outdoor unit received no serial signals from indoor units within 90 seconds after automatic address setting was started. |

| Check items  | E15 | E16 | E20 |
|--|-----|-----|-----|
| Check that the indoor unit power is turned ON.   | ○   |     | ○   |
| Check that the inter-unit control wiring is connected correctly. (Check that there are no open circuits, short circuits, terminal plugs, incorrect wiring to the remote controller terminals, or similar problems.)                          | ○   | ○   | ○   |
| Check that the remote controller wiring is connected correctly. (Check that there are no open circuits, short circuits, incorrect wiring to the inter-unit control wiring terminals, control wiring for group control, or similar problems.) | ○   |     | ○   |
| Check that there are no indoor units where the system address was already incorrectly set by manual or automatic address setting.  |     | ○   |     |

- When automatic address setting is started from the outdoor unit control PCB or from the remote controller, **SETTING** (SETTING) appears on the remote controller at units where the inter-unit control wiring and remote controller wiring are connected correctly. LED 1 and 2 on the outdoor unit control PCB blink alternately.
- In the case of indoor unit group control, if there is a mistake in the remote controller inter-unit control wiring for group control, addresses may not be set even if **SETTING** (SETTING) appears.
- Even if alarm E15 or E16 appears, addresses are set at those indoor units which could be verified. The set addresses can be checked using the remote controller.
- If one of the below alarms appears when the remote controller is operated after automatic address setting was completed (LED 1 and 2 on the outdoor unit control PCB are turned OFF), follow the instructions in the table below and correct the problem location.

| Remote controller display | Cause   |
|---------------------------|---|
| Nothing is displayed.     | The remote controller is not connected correctly (power trouble).<br>The indoor unit power was cut off after automatic address setting was completed.   |
| E01                       | The remote controller is not connected correctly (remote controller receiving trouble).<br>The remote controller of an indoor unit where the indoor unit address is not set is inadvertently operated. (Communications with the outdoor unit are not possible.) |
| E02                       | The remote controller is not connected correctly (trouble with sending of the signal from the remote controller to the indoor unit).  |
| E09                       | The indoor unit ceiling panel connector is not connected correctly.   |

- The outdoor unit maintenance remote controller can be used to check the alarm display. The number of times that LED 1 and 2 blink on the outdoor unit control PCB can be used to check the alarm display. (Refer to "Checking the LED 1 and 2 Alarm Display on the Outdoor Unit Control PCB.")

4

| Alarm Code | Alarm Meaning  |
|------------|--|
| E01        | Remote Controller Reception Error  |
| E02        | Remote Controller Transmission Error   |
| E03        | Error in Indoor Unit Receiving Signal from Remote Controller (central)   |
| E04        | Error in Indoor Unit Receiving Signal from the Outdoor Unit  |
| E06        | Outdoor Unit Failed to Receive Serial Communication Signals from Indoor Unit   |
| E08        | Duplicate Indoor Unit Address Settings Error   |
| E09        | More Than One Remote Controller Set to Main Error  |
| E12        | Automatic Address Setting Start is Prohibited while Auto-address Setting in Progress.                                  |
| E14        | Main Unit duplication in Simultaneous-operation Multi Control (detected outdoor unit)                                  |
| E15        | Automatic Address Alarm (The total capacity of indoor units is too low.)   |
| E16        | Automatic Address Alarm (The total capacity of indoor units is too high or the number of indoor units is two or more.) |
| E18        | Faulty Communication in Group Control Wiring   |
| E20        | Connection Problem of Indoor/Outdoor Units.  |

|     |  |
|-----|--|
| F04 | Compressor Discharge Temperature Sensor (TD) Trouble           |
| F06 | Inlet Temperature Sensor (C1) in Heat Exchanger Trouble        |
| F07 | Intermediate Temperature Sensor (C2) in Heat Exchanger Trouble |
| F08 | Outdoor Air Temperature Sensor (TO) Trouble                    |

## 2-1. Functions of Outdoor Unit PCB

|          |   |
|----------|---|
| CN-A.ADD | <p>2P plug : Automatic address setting pin</p> <ul style="list-style-type: none"> <li>• Short-circuit this pin for 1 second or longer to automatically set the addresses at the indoor units that are connected to that outdoor unit and are within the same system.</li> <li>• The system address is “1” at the time of shipment. Automatic address setting is necessary even for communications lines in a single system where the inter-unit control wiring does not cross to any other systems.</li> <li>• While automatic address setting is in progress, the 2 LEDs (LED1, 2: red) on the outdoor unit control PCB blink alternately. (Short-circuiting this pin while automatic address setting is in progress will stop the automatic address setting operation.)</li> </ul>  |
| S002     | <p>Rotary switch (10 positions, yellow): Outdoor system address setting switch</p> <ul style="list-style-type: none"> <li>• The setting is “1” at the time of shipment. It is not necessary to change the setting if wiring is connected only to an outdoor unit and indoor units in a single system and the inter-unit control wiring does not cross multiple systems.</li> <li>• If wiring links the inter-unit control wiring for multiple systems to the same communications lines, then a different address must be set for each refrigerant tubing system.</li> <li>• If wiring links multiple systems, a maximum of 30 systems (up to 64 indoor units) can be connected. This setting can be set up to “39,” however control will be for 30 systems even if the setting is set to higher than 30. An alarm will be displayed if system addresses are duplicated. (For details, refer to Table 1.)</li> </ul> |
| S003     | <p>DIP switch (2P): Switches for setting system address 10s digit and 20s digit</p> <ul style="list-style-type: none"> <li>• If 10 systems or more are set, the setting is made by a combination of this DIP switch and S002.</li> <li>• If 10 – 19 systems are set, set switch 1 (10s digit) to ON.</li> <li>• If 20 – 29 systems are set, set switch 2 (20s digit) to ON, and set switch 1 (10s digit) to OFF.</li> <li>• If 30 systems are set, set both switch 1 (10s digit) and switch 2 (20s digit) to ON.</li> </ul> <p>(For details concerning S002 and S003, refer to Table 1.)</p>  |
| JP001    | <p>Jumper wire</p>  |
| TERMINAL | <p>3P plug : For communications circuit impedance matching</p> <ul style="list-style-type: none"> <li>• A connecting socket (3P, black) is attached to the terminal plug at the time of shipment from the factory.</li> <li>• In the case of link wiring which combines the inter-unit control wiring for multiple systems into a single communications circuit, leave the connecting socket in place at only one of the outdoor units, and move the socket from the “SHORT” side to the “OPEN” side at all other outdoor units. If multiple connecting sockets are left in place, communications trouble will occur.</li> </ul>  |

|                              |  |
|------------------------------|--|
| LED 1 (D302)<br>LED 2 (D303) | LED (red × 2) <ul style="list-style-type: none"> <li>• LED 1 and 2 blink alternately while automatic address setting is in progress.</li> <li>• Display the alarm contents for alarms that are detected by the outdoor unit.</li> </ul>  |
| Power LED<br>(D330)          | LED (green): Power indicator<br>Indicates the DC 5V power on the outdoor unit control PCB.   |
| RUN<br>(CN-RUN)              | 2P plug (black) : Start pin<br>Short-circuit this pin and apply a pulse signal to start all indoor units in that refrigerant system.   |
| Stop<br>(CN-STOP)            | 2P plug (black): Stop pin<br>Short-circuit this pin and apply a pulse signal to stop all indoor units in that refrigerant system.  |
| PUMP DOWN<br>(CN-PUMPDOWN)   | 2P plug (black): Refrigerant recovery Pin <ul style="list-style-type: none"> <li>• Short circuit this pin to perform refrigerant recovery control using cooling operation. The indoor unit fan will operate at HIGH and 55 Hz for a maximum of 10 minutes. When refrigerant recovery is completed, close the valves and open circuit this pin to stop the operation.</li> </ul>  |
| Mode change<br>(CN-MODE)     | 3P plug (black): Indoor unit Heating/Cooling mode change pin <ul style="list-style-type: none"> <li>• When operating the compressors to perform automatic address setting, operation in Heating mode can be normally used. However, short-circuiting this pin performs operation in Cooling mode. (Static signal)</li> <li>• Short-circuiting this pin during ordinary operation changes the mode from Cooling to Heating (if the current mode is Cooling) or from Heating to Cooling (if the current mode is Heating).</li> </ul> |
| Test<br>(CN-TEST)            | 2P plug (black) <ul style="list-style-type: none"> <li>• This pin is used to test the PCB at the factory.</li> <li>• When the power is turned ON after this pin has been short-circuited, all output signals will be output in sequence. (Sequential output does not occur if this pin is short-circuited when the power is already ON.) Releasing this pin returns the unit to normal control.</li> </ul>   |
| CHK<br>(CN-CHK)              | 2P plug (black)<br>Short-circuit during the test run operation.<br>Open the circuit after the test run.  |

**Table 1. Setting the System Address [S002: Rotary switch (yellow), S003: 2P DIP (black)]**

|                                  | Outdoor system address No. | S002 setting (system address switch) | S003 setting   |                |

|                                  | 30                         | 0                                    | ON             | ON             |

## 2-2. Self-Diagnostics Function Table

- Causes and corrections in instances when automatic address setting cannot be started.

| Trouble  | Cause and correction  |
|--|---|
| The power LED on the outdoor unit control PCB does not turn ON.  | Check for any errors in the power wiring to the outdoor unit, and check for a missing phase.  |
| LED 1 and 2 on the outdoor unit control PCB do not turn OFF when the outdoor unit power is turned ON, and automatic address setting cannot be started. | Check the "Alarm Displays" table and correct the problem.   |
| An alarm appears immediately when automatic address setting is started from the remote controller.   |   |
| Nothing happens when the operator attempts to start automatic address setting from the remote controller.  | Check that the remote controller wiring and the inter-unit control wiring are connected correctly.<br>Check that the indoor unit power is ON. |

- Causes and corrections in instances when automatic address setting starts, but cannot be completed successfully.

| Trouble  | Cause and correction   |
|--|--|
| An alarm appears on the remote controller sometime from several seconds to several minutes after automatic address setting is started.   | Check the "Alarm Displays" table and correct the problem.  |
| LED 1 and 2 on the outdoor unit control PCB indicate that automatic address setting is in progress (the LEDs blink alternately) for several minutes after automatic address setting is started (the compressors may also start and stop several times), however LED 1 and 2 never indicate that automatic address setting is completed (turn OFF). | Check the alarm details on the "Outdoor Unit Control PCB LED 1 and 2 Alarms" table, then check the "Alarm Displays" table and correct the problem. |

- If alarm E15, E16, or E20 appears after automatic address setting is started, check the following items.

| Alarm display | Alarm description  |
|---------------|--|
| E15           | The total capacity of indoor units is too lower than that of outdoor unit.   |
| E16           | The total capacity of indoor units is too higher than that of outdoor unit.  |
| E20           | The outdoor unit received no serial signals from indoor units within 90 seconds after automatic address setting was started. |

| Check items  | E15 | E16 | E20 |
|--|-----|-----|-----|
| Check that the indoor unit power is turned ON.   | ○   |     | ○   |
| Check that the inter-unit control wiring is connected correctly. (Check that there are no open circuits, short circuits, terminal plugs, incorrect wiring to the remote controller terminals, or similar problems.)                          | ○   | ○   | ○   |
| Check that the remote controller wiring is connected correctly. (Check that there are no open circuits, short circuits, incorrect wiring to the inter-unit control wiring terminals, control wiring for group control, or similar problems.) | ○   |     | ○   |
| Check that there are no indoor units where the system address was already incorrectly set by manual or automatic address setting.  |     | ○   |     |

- When automatic address setting is started from the outdoor unit control PCB or from the remote controller, **SETTING** (SETTING) appears on the remote controller at units where the inter-unit control wiring and remote controller wiring are connected correctly. LED 1 and 2 on the outdoor unit control PCB blink alternately.
- In the case of indoor unit group control, if there is a mistake in the remote controller inter-unit control wiring for group control, addresses may not be set even if **SETTING** (SETTING) appears.
- Even if alarm E15 or E16 appears, addresses are set at those indoor units which could be verified. The set addresses can be checked using the remote controller.
- If one of the below alarms appears when the remote controller is operated after automatic address setting was completed (LED 1 and 2 on the outdoor unit control PCB are turned OFF), follow the instructions in the table below and correct the problem location.

| Remote controller display | Cause   |
|---------------------------|---|
| Nothing is displayed.     | The remote controller is not connected correctly (power trouble).<br>The indoor unit power was cut off after automatic address setting was completed.   |
| E01                       | The remote controller is not connected correctly (remote controller receiving trouble).<br>The remote controller of an indoor unit where the indoor unit address is not set is inadvertently operated. (Communications with the outdoor unit are not possible.) |
| E02                       | The remote controller is not connected correctly (trouble with sending of the signal from the remote controller to the indoor unit).  |
| E09                       | The indoor unit ceiling panel connector is not connected correctly.   |

- The outdoor unit maintenance remote controller can be used to check the alarm display.  
The number of times that LED 1 and 2 blink on the outdoor unit control PCB can be used to check the alarm display.  
(Refer to "Checking the LED 1 and 2 Alarm Display on the Outdoor Unit Control PCB.")

| Alarm Code | Alarm Meaning   |
|------------|---|
| E01        | Remote Controller Reception Error   |
| E02        | Remote Controller Transmission Error  |
| E03        | Error in Indoor Unit Receiving Signal from Remote Controller (central)  |
| E04        | Error in Indoor Unit Receiving Signal from the Outdoor Unit   |
| E05        | Error in Indoor Unit Transmitting Signal to the Outdoor Unit  |
| E06        | Outdoor Unit Failed to Receive Serial Communication Signals from Indoor Unit  |
| E08        | Duplicate Indoor Unit Address Settings Error  |
| E09        | More Than One Remote Controller Set to Main Error   |
| E12        | Automatic Address Setting Start is Prohibited while Auto-address Setting in Progress.                                     |
| E14        | Main Unit duplication in Simultaneous-operation Multi Control (detected outdoor unit)                                     |
| E15        | Automatic Address Alarm (The total capacity of indoor units is too low.)  |
| E16        | Automatic Address Alarm (The total capacity of indoor units is too high or the total number of indoor units is too many.) |
| E18        | Faulty Communication in Group Control Wiring  |
| E20        | Connection Problem of Indoor/Outdoor Units.   |

|     |  |
|-----|--|
| F04 | Compressor Discharge Temperature Sensor (TD) Trouble           |

|  | Outdoor unit EEPROM trouble                              | F31  | Operating and timer lamp blinking simultaneously |   |       |         |

## 5-2. Outdoor Unit Control Panel LED Display

( ○ : ON    ☀ : Blinking    ● : OFF )

| LED1                            | LED2 | Display meaning   |
|---------------------------------|------|---|
| ○                               | ○    | After the power is turned ON (and automatic address setting is not in progress), no communication with the indoor units in that system is possible.   |
| (Both ON)                       |      |   |
| ●                               | ○    | After power is turned ON (and automatic address setting is not in progress), 1 or more indoor units are confirmed in that system; however, the number of indoor units does not match the number that was set.   |
| (OFF)                           | (ON) |   |
| ●                               | ●    | Automatic address setting was completed successfully. (After the power is turned ON, the number of detected indoor units connected to that system matches the number that was set, and regular communications are occurring.)   |
| (Both OFF)                      |      |   |
| ☀                               | ☀    | Automatic address setting is in progress.   |
| (Blinking alternately)          |      |   |
| ☀                               | ☀    | Alarm display<br>LED 1 blinks M times, then LED 2 blinks N times. The cycle then repeats.<br>M = 2: P alarm 3: H alarm 4: E alarm 5: F alarm 6: L alarm<br>N = Alarm No.<br>Example: LED 1 blinks 2 times, then LED 2 blinks 16 times. The cycle then repeats.<br>Alarm is "P16." |
| (Blinking alternately)          |      |   |
| ☀                               | ○    | PUMP DOWN is in progress.   |
| LED 1 : Blinking<br>LED 2 : ON  |      |   |
| ☀<br>(0.8 / 0.3) *              | ●    | P04 (High pressure trouble) Pre-trip display  |
| LED 1 : Blinking<br>LED 2 : OFF |      |   |
| ☀<br>(0.5 / 0.5)                | ●    | Other Pre-trip display  |
| LED 1 : Blinking<br>LED 2 : OFF |      |   |

\* Blinking (0.8 / 0.3) indicates that the lamp illuminates for 0.8 seconds, and then is OFF 0.3 seconds.

### 5-3. PAC System Alarm Codes

U-36PE2E5A, U-50PE2E5A, U-60PE2E5A  
U-60PEY2E5, U-71PEY2E5

#### Alarms for outdoor units

| Alarm Code | Alarm Meaning  |
|------------|--|
| E01        | Remote Controller Reception Error  |
| E02        | Remote Controller Transmission Error   |
| E03        | Error in Indoor Unit Receiving Signal from Remote Controller (central)   |
| E04        | Error in Indoor Unit Receiving Signal from the Outdoor Unit  |
| E05        | Error in Indoor Unit Transmitting Signal to the Outdoor Unit   |
| E06        | Outdoor Unit Failed to Receive Serial Communication Signals from Indoor Unit   |
| E08        | Duplicate Indoor Unit Address Settings Error   |
| E09        | More Than One Remote Controller Set to Main Error  |
| E12        | Automatic Address Setting Start is Prohibited while Auto-address Setting in Progress.                                  |
| E14        | Main Unit duplication in Simultaneous-operation Multi Control (detected outdoor unit)                                  |
| E15        | Automatic Address Alarm (The total capacity of indoor units is too low.)   |
| E16        | Automatic Address Alarm (The total capacity of indoor units is too high or the number of indoor units is two or more.) |
| E18        | Faulty Communication in Group Control Wiring   |
| E20        | Connection Problem of Indoor/Outdoor Units.  |
|            |  |
| F04        | Compressor Discharge Temperature Sensor (TD) Trouble   |
| F06        | Inlet Temperature Sensor (C1) in Heat Exchanger Trouble  |
| F07        | Intermediate Temperature Sensor (C2) in Heat Exchanger Trouble   |
| F08        | Outdoor Air Temperature Sensor (TO) Trouble  |
| F12        | Compressor Inlet Suction Temperature Sensor (TS) Trouble   |
| F31        | Outdoor Unit Nonvolatile Memory (EEPROM) Trouble   |
|            |  |
| H01        | Primary (input) Overcurrent Detected   |
| H02        | PAM Trouble  |
| H03        | Primary Current CT Sensor (current sensor) Failure   |
| H31        | HIC Trouble  |
|            |  |
| L04        | Outdoor Unit Address Duplication   |
| L10        | Outdoor Unit Capacity not Set or Invalid   |
| L13        | Indoor Unit Type Setting Error   |
| L18        | 4-way Valve Operation Failure  |
|            |  |
| P03        | Compressor Discharge Temperature Trouble   |
| P04        | High Pressure Trouble  |
| P05        | AC Power Supply Trouble  |
| P13        | Alarm Valve Open   |
| P14        | O <sub>2</sub> Sensor Detect   |
| P15        | Insufficient Gas Level Detected  |
| P16        | Compressor Overcurrent Trouble   |
| P22        | Outdoor Unit Fan Motor Trouble   |
| P29        | Lack of INV compressor wiring, INV compressor actuation failure (including locked), DCCT failure                       |
| P31        | Group Control Error  |

Symptoms and Parts to Inspect

| Remote controller alarm display | Alarm contents   | Judgement conditions   | Eliminating condition of alarm | Judgement and correction  |
|---------------------------------|--|--|--------------------------------|---|
| P03                             | Abnormal discharge temperature error<br>• Discharge temp. detected at or above the specified value                             | Stops when temp. exceeds 101 °C.<br>Alarm output on 5 pre-trips  | Recovery at restart            | 1. Check refrigerant cycle (gas leak).<br>2. Trouble with electronic expansion valve<br>3. Check discharge temperature sensor (TD).   |
| P05                             | CT disconnected or AC power supply error   | The current value transmitted from the microcomputer on the outdoor unit control substrate is low.<br>When no AC power input for more than 30 seconds to 5 minutes : Single alarm                              | Recovery at restart            | 1. Check outdoor unit control PCB.<br>2. Lack of reactor wire   |
| P15                             | Insufficient gas level detected.   | • Discharge temperature is 95 °C or higher.<br>• Electronic expansion valve is at Step 480.<br>When the above has continued for 1 minute. Indoor air sucking due to body thermostat max (E1 or E2) - TA ≤ 4 °C | Recovery at restart            | 1. Check refrigerant cycle (gas leak).<br>2. Trouble with electronic expansion valve<br>3. Check outdoor unit valve opening.  |
| L18                             | 4-way valve operation failure<br>• Judged after heating operating for 5 minutes consecutively.                                 | The indoor unit heat exchanger temperature drops even though the compressor is switched on during the heating mode:<br>To +20 °C ≤ C1<br>Pre-trip 1 time   | Recovery at restart            | 1. Check 4-way valve.<br>2. Check 4-way valve wiring.<br>3. Check outdoor unit control PCB.   |
| P04                             | High-pressure protection error   | High pressure switched ON → OFF<br>(Alarm is output when switch opened.) Pre-trip 4 times.   | Recovery at restart            | Overload operation of refrigerant cycle   |
| P22                             | Outdoor unit fan motor trouble<br>• Inverter protection circuit was activated, or lock was detected at outdoor unit fan motor. | Inverter stops after alarm is detected. Pre-trip 10 times  | Recovery at restart            | 1. Position detection trouble.<br>2. Outdoor unit fan motor over-current Protection circuit is activated.<br>• Check outdoor unit control PCB.<br>• Refer to outdoor unit fan judgement methods.  |
| P29                             | Lack of INV compressor wiring, INV compressor actuation failure, DCCT failure  | Inverter stops after alarm is detected. Alarm is output when inverter stops (pre-trip) consecutively 10 times.   | Recovery at restart            | 1. Overload operation of refrigerant cycle<br>2. Layer short on the compressor<br>3. Check the outdoor unit control PCB.<br>4. Check the inverter compressor wiring. (Open phase/Reverse phase)<br>5. Compressor locked<br>6. Valve (or refrigerant circuit) blockage<br>7. Check the refrigerant cycle (gas leak). |
| H31                             | HIC trouble  | Pre-trip consecutively 10 times  | Temperature dropped            | Heat sink and PCB (HIC)<br>• Contact trouble  |

| P04                             | High-pressure protection error   | High pressure switched ON → OFF<br>(Alarm is output when switch opened.) Pre-trip 4 times.   | Recovery at restart            | Overload operation of refrigerant cycle  |
| P22                             | Outdoor unit fan motor trouble<br>• Inverter protection circuit was activated, or lock was detected at outdoor unit fan motor. | Inverter stops after alarm is detected. Pre-trip 10 times  | Recovery at restart            | 1. Position detection trouble.<br>2. Outdoor unit fan motor over-current Protection circuit is activated.<br>• Check outdoor unit control PCB.<br>• Refer to outdoor unit fan judgement methods. |
| P29                             | Lack of INV compressor wiring, INV compressor actuation failure, DCCT failure  | Inverter stops after alarm is detected. Alarm is output when inverter stops (pre-trip) consecutively 10 times.   | Recovery at restart            | 1. Stops immediately even when operations restarted.<br>• Layer short on the compressor<br>2. Check HIC circuit.<br>• Wiring trouble   |
| H31                             | HIC trouble  | Pre-trip consecutively 10 times  | Temperature dropped            | Heat sink and PCB (HIC)<br>• Contact trouble   |

## Check Prior to Auto Address Setting

\* If an outdoor unit displays an alarm, conduct this process after diagnosing the problem.

|   |  |   |     |                        |
|---|--|---|-----|------------------------|
| 1 Auto Address                          | 1-1  | Is the power of the indoor unit(s) and outdoor unit(s) on?  | Yes | 2-1                    |
|   |  |   | No  | Power on               |
| 2 Indoor/<br>outdoor<br>control line    | 2-1  | Has the wiring of the indoor/outdoor control line been completed?<br>Is it all connected?   | Yes | 2-2                    |
|   |  |   | No  | Connect the wiring     |
|   | 2-2  | Has high voltage (over AC200V) been applied to the control line circuit? Has the fuse on the control PC board blown?<br>(Check each board of the indoor unit(s) and outdoor unit(s).) | Yes | 2-3                    |
|   |  |   | No  | 3-1                    |
| 2-3                                     | The power line and indoor/outdoor control line are miswired. Turn off the power, check & correct the miswiring and then make connections of the indoor/outdoor control lines to the emergency side of all the control PC boards and controllers. |   |     |                        |
| 3 Installation<br>or setting<br>related | 3-1  | Be sure that the indoor and outdoor units are connected with correct combination written in catalog.  | Yes | 3-2                    |
|   |  |   | No  | Correct the connection |
|   | 3-2  | Is the indoor/outdoor control line connected to more than one outdoor unit? (Network wired?)  | Yes | 3-3                    |
|   |  |   | No  | 3-6                    |
|   | 3-3  | Is the Terminal resistor select switch on the outdoor control PC board set to just one unit?  | Yes | 3-4                    |
|   |  |   | No  | Correct the setting    |
|   | 3-4  | Are other outdoor units using a duplicate setting?  | Yes | 3-5                    |
|   |  |   | No  | 3-6                    |
| 3-5                                     | When units are networked, first set the system address for each outdoor unit in the order 1-2-3 and then run auto address setting.   |   |     |                        |
| 3-6                                     | Run the auto address setting.  |   |     |                        |

## E01 Remote Controller Reception Error

(When indoor unit(s) are connected)

### 1. Error Detection Method

It is judged an error if no self-addressed communication is sent to the remote controller in a 3-minute period.

- When a remote controller is set to sub remote controller.
- When there are nine or more indoor units in a remote control group's wiring.
- When the CHK (check pin) and/or TEST (test pin) on the indoor unit control PC board are short circuited.
- The nonvolatile memory (EEPROM) is not installed or faulty when turning on the power.
- Indoor unit control PC board error
- Remote controller check mode
- Malfunctions of the remote controller itself (reception circuit error)

### 2. Error Diagnosis

|                                   |   |  |  |                    |
|-----------------------------------|---|--|--|--------------------|
| 1 Auto Address                    | 1-1   | Is auto address setting complete?  | Yes                                      | 1-2                |
|                                   |   |  | No                                       | 1-3                |
|                                   | 1-2   | Is there an auto address setting error (Is the outdoor unit showing an alarm)?   | Yes                                      | 1-3                |
|                                   |   |  | No                                       | 2-1                |
| 1-3                               | Conduct checks prior to auto address setting.   |  |  |                    |
| 2 Group Control Wiring            | 2-1   | Is that indoor unit under group control?   | Yes                                      | 2-2                |
|                                   |   |  | No                                       | 3-1                |
|                                   | 2-2   | Are there any indoor units with their power off in the remote control group's wiring?  | Yes                                      | Power on           |
|                                   |   |  | No                                       | 2-3                |
|                                   | 2-3   | Are nine or more indoor units connected in one remote control group's wiring?  | Yes                                      | Correct the wiring |
|                                   |   |  | No                                       | 2-4                |
| 2-4                               | Was the remote control group's wiring changed after auto address setting was complete? Alternatively, were group settings changed in the remote control detailed settings mode?   | Yes  | 2-5                                      |                    |
|                                   |   | No   | 3-1                                      |                    |
| 2-5                               | No main unit in the remote control group's wiring? Re-execute auto address setting.   |  |  |                    |
| 3 Installation or setting related | 3-1   | Are the CHK pin and TEST pin on the indoor unit control board short-circuited?   | Yes                                      | Remove the short   |
|                                   |   |  | No                                       | 3-2                |
|                                   | 3-2   | Is the wireless remote controller connected to on the indoor unit's control PC board?  | Yes                                      | 3-3                |
|                                   |   |  | No                                       | 3-5                |
|                                   | 3-3   | Disconnect the connector mentioned above on the PC board of the indoor unit control PC board, and see whether the E01 goes off after several minutes. (When doing so, if two remote controllers are being used and the wireless remote controller is the main remote controller, set the other remote controller as the main.) | Yes                                      | 3-4                |
|                                   |   |  | No                                       | 3-5                |
|                                   | 3-4   | Replace wireless remote control parts including wiring.  |  |                    |
|                                   | 3-5   | Is the LED blinking on the indoor unit's control PC board?   | Yes                                      | 3-6                |
| No                                |   |  | 3-7                                      |                    |
| 3-6                               | The nonvolatile memory (EEPROM) on the indoor unit's control PC board is either not installed, improperly installed or the nonvolatile memory is faulty. Correct this or after replacing the nonvolatile memory, write model data to it in the remote control detailed settings mode. |  |  |                    |
| 3-7                               | Is there a short, miswiring, disconnection, wrong contact or grounding in the remote control's wiring?  | Yes  | Correct the wiring                       |                    |
|                                   |   | No   | Replace the indoor unit's control board. |                    |

- Regarding the remote controller check, refer to the Reference Materials.
- For information on the procedures for replacing the nonvolatile memory (EEPROM) of the indoor unit and/or replacing the indoor unit's control board, refer to the manual that is packaged with the indoor unit service board.

## E02 Remote Controller Transmission Error

### 1. Error Detection Method

When the remote controller itself cannot transmit. Or when it cannot receive the signal it transmitted itself, or when they are different and judged an error.

- Malfunction of the remote controller itself (transmit circuit error)

### 2. Error Diagnosis

|                               |   |   |  |                    |
|-------------------------------|---|---|--|--------------------|
| 1 Remote Control Group Wiring | 1-1   | Is the indoor unit under group control?   | Yes  | 1-2                |
|                               |   |   | No   | 2-1                |
|                               | 1-2   | Are the wires 1 (white) & 2 (black) to the remote control group shorted or opened?  | Yes  | Correct the wiring |
|                               |   |   | No   | 2-1                |
| 2 Group Control Wiring        | 2-1   | Is the wireless remote controller connected to on the indoor unit's control PC board?   | Yes  | 2-2                |
|                               |   |   | No   | 2-4                |
|                               | 2-2   | Disconnect the connector mentioned above on the board of the indoor unit control PC board, and see whether the E02 goes off after several minutes. (When doing so, if two remote controllers are being used and the wireless remote controller is the main remote controller, set the other remote controller as the main.) | Yes  | 2-3                |
|                               |   |   | No   | 2-4                |
|                               | 2-3   | Replace wireless remote control parts including wiring.   |  |                    |
| 2-4                           | Is there a short, miswiring, open, wrong contact or grounding in the remote control's wiring? | Yes   | Correct the wiring                         |                    |
|                               |   | No  | Replace the indoor unit's control PC board |                    |

- Regarding the remote controller check, refer to the Reference Materials.
- For information on the procedures for replacing the nonvolatile memory (EEPROM) of the indoor unit and/or replacing the indoor unit's control board, refer to the manual that is packaged with the indoor unit service board.

## E03 Error in Indoor Unit Receiving Signal from Remote Controller (central)

(When indoor unit(s) are connected)

### 1. Error Detection Method

It is judged an error when there is no communication from any remote controller (collectively) in a 3-minute period or if there is no communication from the central device in a 15-minute period.

- When there was once communication, but during use the remote control wiring is opened or miswired.
- The line to the central control unit for indoor/outdoor operations is opened.
- Settings are made only for sub remote controller.
- The power to the central control unit is not on and remote controllers are not being used (or the indoor/outdoor operations line to the central control unit is opened).
- When remote controller are not being used, only the sub remote controller is set up.

### 2. Error Diagnosis

|                                |  |  |                                       |          |
|--------------------------------|--|--|---------------------------------------|----------|
| 1 Central control unit         | 1-1  | Is the central control unit connected?   | Yes                                   | 1-2      |
|                                |  |  | No                                    | 2-1      |
|                                | 1-2  | Is the central control unit's powered off?   | Yes                                   | Power on |
|                                |  |  | No                                    | 1-3      |
|                                | 1-3  | Are all the Main/Sub switches on the connected central control unit set to Sub?  | Yes                                   | 1-4      |
| No                             |  |  | 1-5                                   |          |
| 1-4                            | Of the central control units that are connected, set only the uppermost central control unit to Main and the others to Sub. The order from top to bottom is communication adaptor → system controller → ON/OFF controller. |  |                                       |          |
| 1-5                            | Is the indoor/outdoor operations line connected to the central control unit opened?  | Yes  | Correct the setting                   |          |
|                                |  | No   | 2-1                                   |          |
| 2 Remote controller            | 2-1  | Is the indoor unit under group control?  | Yes                                   | 2-2      |
|                                |  |  | No                                    | 3-1      |
| 2-2                            | Are the wires 1 (white) & 2 (black) to the remote control group opened, have wrong contact or grounded?  | Yes  | Correct the setting                   |          |
|                                |  | No   | 3-1                                   |          |
| 3 Indoor unit control PC board | 3-1  | Is the wireless remote controller connected to on the indoor unit's control PC board?  | Yes                                   | 3-2      |
|                                |  |  | No                                    | 3-4      |
|                                | 3-2  | Disconnect the connector mentioned above on the control PC board of the indoor unit control PC board, and see whether the E03 goes off after several minutes. (When doing so, if two remote controllers are being used and the wireless remote controller is the main remote controller, set the other remote controller as the main.) | Yes                                   | 3-3      |
|                                |  |  | No                                    | 3-4      |
| 3-3                            | Replace wireless remote control parts including wiring.  |  |                                       |          |
| 3-4                            | Is there a short, miswiring, open, wrong contact or grounding in the remote control's wiring?  | Yes  | Correct the wiring                    |          |
|                                |  | No   | Replace the indoor unit control board |          |

- Regarding the remote controller check, refer to the Reference Materials.
- For information on the procedures for replacing the nonvolatile memory (EEPROM) of the indoor unit and/or replacing the indoor unit's control board, refer to the manual that is packaged with the indoor unit service board.

**A7302060** : 4-Way Cassette Type (Type U2) Indoor Unit Control Board

**A747938** : Duct Type Indoor Unit Control Board

## E04 Error in Indoor Unit Receiving Signal from the Outdoor unit

### 1. Error Detection Method

When there is no communication within a 3-minute period from the outdoor unit. Or, judged an error when no reply comes from the outdoor unit.

- The outdoor unit is not turned on.
- When the network of indoor/outdoor operation line was wired, the (SHORT) setting of the terminal resistor switch on the outdoor control PC board was set on multiple units (four or more).
- When the power was turned on after auto address setting was completed, the number of indoor units had been changed.
- Forgot to turn on the indoor unit.
- The CHK pin and/or TEST pin on the indoor unit's control PC board are shorted.
- Forgot to install the nonvolatile memory (EEPROM) when replacing the indoor unit control PC board.
- Mistakenly set the indoor unit address to Not Set in the remote control's detailed settings mode.
- When indoor unit addresses are duplicated.
- There is a short, open, wrong contact or grounding of the indoor/outdoor operation line.
- There is an error in the receiving circuit on the signal output PC board (optional control PC board).
- Malfunctions of the outdoor unit
- High voltage was applied (over AC200V) in the indoor/outdoor operations line circuit.
- The thermistor inside the indoor unit is grounded.

### 2. Error Diagnosis

|                                |   |  |  |  |
|--------------------------------|---|--|--|--|
| 1 Power Source                 | 1-1   | Is/was the power to the outdoor unit cut off?  | Yes                                    | After turning the power on, wait three minutes |
|                                |   |  | No                                     | 1-2  |
|                                | 1-2   | Is the indoor unit powered off?  | Yes                                    | Power on                                       |
|                                |   |  | No                                     | 2-1  |
| 2 Indoor/outdoor control line  | 2-1   | Is the indoor/outdoor operation line shorted, opened, grounded or has a wrong contact?   | Yes                                    | Correct the wiring                             |
|                                |   |  | No                                     | 2-2  |
|                                | 2-2   | When the network of indoor/outdoor operation line was wired, was the (SHORT) setting of the terminal resistor switch on the outdoor control PC board set on multiple units (four or more)?   | Yes                                    | Normally the (SHORT) setting is just one unit. |
|                                |   |  | No                                     | 2-3  |
| 2-3                            | Was a high voltage (over AC200V) applied in the indoor/outdoor operations line circuit?   | Yes  | 3-2                                    |  |
|                                |   | No   | 3-1                                    |  |
| 3 No. of Indoor Units          | 3-1   | Was the number of indoor units increased or decreased after auto address setting was complete?   | Yes                                    | 3-2  |
|                                |   |  | No                                     | 3-3  |
|                                | 3-2   | Conduct checks prior to auto address setting.  |  |  |
| 3-3                            | Check the indoor unit addresses from the remote control's detailed settings mode. Is it Not Set (99), or is the indoor unit's address duplicated?   | Yes  | 3-2                                    |  |
|                                |   | No   | 4-1                                    |  |
| 4 Indoor unit control PC board | 4-1   | Are the CHK pin and/or TEST pin on the indoor unit control PC board short-circuited?   | Yes                                    | Remove the short                               |
|                                |   |  | No                                     | 4-2  |
|                                | 4-2   | Is the wireless remote controller connected to on the indoor unit's control PC board?  | Yes                                    | 4-3  |
|                                |   |  | No                                     | 4-5  |
|                                | 4-3   | Disconnect the connector mentioned above on the control PC board of the indoor unit control PC board, and see whether the E04 goes off after several minutes. (When doing so, if two remote controllers are being used and the wireless remote controller is the main remote controller, set the other remote controller as the main.) | Yes                                    | 4-4  |
|                                |   |  | No                                     | 4-5  |
|                                | 4-4   | Replace wireless remote control parts including wiring.  |  |  |
| 4-5                            | Is the LED on the indoor unit control PC board blinking?  | Yes  | 4-6                                    |  |
|                                |   | No   | 4-7                                    |  |
| 4-6                            | The nonvolatile memory (EEPROM) on the indoor unit's control PC board is either not installed, improperly installed or the nonvolatile memory is faulty. Correct this or after replacing the nonvolatile memory, write model data to it in the remote control detailed settings mode. |  |  |  |
| 4-7                            | Are all the remote controllers of the other indoor units connected to that outdoor unit displaying E04?   | Yes  | Replace the outdoor unit control board |  |
|                                |   | No   | Replace the indoor unit control board  |  |

- Regarding the remote controller check, refer to the Reference Materials.
- For information on the procedures for replacing the nonvolatile memory (EEPROM) of the indoor unit and/or replacing the indoor unit's control board, refer to the manual that is packaged with the indoor unit service board.

## E05 Error in Indoor Unit Transmitting Signal to the Outdoor Unit

### 1. Error Detection Method

It is judged an error when a unit itself cannot receive a signal that it has sent.

- Indoor unit control PC board error
- The setting of the terminal resistor select switch on the outdoor unit main PC board is set incorrectly.

### 2. Error Diagnosis

|                                |   |  |                    |                                |
|--------------------------------|---|--|--------------------|--------------------------------|
| 1 Indoor unit control PC board | 1-1   | Is the indoor/outdoor operation line connected to more than one outdoor unit? (Network wired?)                             | Yes                | 1-2                            |
|                                |   |  | No                 | 1-3                            |
|                                | 1-2   | Is the SHORT on the terminal resistor select switch on the outdoor main PC board set to one unit, and the others are OPEN? | Yes                | 1-4                            |
|                                |   |  | No                 | Set the SHORT to one unit only |
|                                | 1-3   | Is the terminal resistor select switch on the outdoor main PC board set to OPEN?   | Yes                | Make the SHORT setting         |
| No                             |   |  | 1-4                |                                |
| 1-4                            | Is the indoor/outdoor operation line opened or shorted? | Yes  | Correct the wiring |                                |
|                                |   | No   | 1-5                |                                |
|                                | 1-5   | Replace the indoor unit control PC board.  |                    |                                |

- For information on the procedures for replacing the indoor unit's control PC board, refer to the manual that is packaged with the indoor unit service board.

## E06 Outdoor Unit Failed to Receive Serial Communication Signals from Indoor Unit

(When indoor unit(s) are connected)

### 1. Error Detection Method

It is judged an error when there is no transmission (reply) from the indoor unit to the outdoor unit for a period of three minutes.

- The indoor unit is not turned on.
- The DISP pin of the indoor unit is shorted.
- There is a short, open, wrong contact or grounding of the indoor/outdoor operation line.
- The signal output control PC board (optional control PC board) inside the indoor unit has failed.
- The thermistor inside the indoor unit is grounded.

### 2. Error Diagnosis

|                                 |   |  |     |                    |
|---------------------------------|---|--|-----|--------------------|
| 1 Indoor unit power             | 1-1   | Is the indoor unit powered off?  | Yes | Power on           |
|                                 |   |  | No  | 2-1                |
| 2 Indoor/outdoor operation line | 2-1   | Is the indoor/outdoor operation line shorted, opened, grounded or has a wrong contact?   | Yes | Correct the wiring |
|                                 |   |  | No  | 3-1                |
| 3 Indoor units control PC board | 3-1   | Are the DISP pin and CHK pin on the indoor unit control PC board short-circuited?  | Yes | Remove the short   |
|                                 |   |  | No  | 3-2                |
|                                 | 3-2   | Is the wireless remote controller connected to on the indoor unit's control PC board?  | Yes | 3-3                |
|                                 |   |  | No  | 3-5                |
|                                 | 3-3   | Disconnect the connector mentioned above on the control PC board of the indoor unit control PC board, and see whether the E06 goes off after several minutes. (When doing so, if two remote controllers are being used and the wireless remote controller is the main remote controller, set the other remote controller as the main.) | Yes | 3-4                |
|                                 |   |  | No  | 3-5                |
| 3-4                             | Replace wireless remote control parts including wiring. |  |     |                    |
| 3-5                             | Indoor unit control PC board failure → Replace board.   |  |     |                    |

- For information on the procedures for replacing the indoor unit's control board, refer to the manual that is packaged with the indoor unit control PCB.

**A7302060 : 4-Way Cassette Type (Type U2)**

**A747931 : Ceiling Type (Type T2)**

**A747938 : Duct Type**

**A747336 : 4-Way Cassette 60 x 60 Type**

## E08 Duplicate Indoor Unit Address Settings Error

### 1. Error Detection Method

It is judged an error if the addresses of indoor units are duplicated.

- The indoor unit address settings are duplicated in the remote control detailed settings mode.
- The multiple unit DISP pin is shorted across the indoor unit whose address is Not Set.

### 2. Error Diagnosis

|                                |     |   |     |                  |
|--------------------------------|-----|---|-----|------------------|
| 1 Indoor unit control PC board | 1-1 | Is the DISP pin on the indoor unit control PC board shorted?  | Yes | Remove the short |
|                                |     |   | No  | 1-2              |
|                                | 1-2 | Conduct checks prior to auto address setting.<br>Does E08 fail to go off even after running auto address setting again?                                   | Yes | 1-3              |
|                                |     |   | No  | 1-4              |
|                                | 1-3 | The nonvolatile memory (EEPROM) on the indoor unit board has failed.<br>↓<br>Replace the EEPROM.  |     |                  |
|                                | 1-4 | Do not make changes to indoor unit addresses with the detailed settings of the remote controller.<br>Make them in the remote control address change mode. |     |                  |

- For information on the procedures for replacing the nonvolatile memory (EEPROM) of the indoor unit, refer to the manual that is packaged with the indoor unit service board.

## E09 More Than One Remote Controller Set to Main Error

### 1. Error Detection Method

It is judged an error when more than one remote controller in a remote control group is set as the main remote controller.

- Forgot to set one remote controller to sub in a 2-remote control group.
- When using one wireless and one wired remote controller in a control group, forgot to set one of them to sub.

### 2. Error Diagnosis

|                     |     |   |
|---------------------|-----|---|
| 1 Remote controller | 1-1 | Set one of the 2 remote controllers to sub. |
|---------------------|-----|---|

- Method for setting a remote controller to sub (CZ-RTC2)

1. Press and hold both + buttons for 4 seconds or longer.
2. This will display **SETTING**, the item "01" and the setting data "0001" or the like on the remote controller's display.
3. Press Timer / buttons to switch the setting data to "0000". (0000:SUB 0001:Main)
4. Press button (Once the display changes from flashing to steady, the setting is complete).
5. Once you press button, the remote controller returns to its normal display.

#### CZ-RWSL2

## **E12 Automatic Address Setting Start is Prohibited while Auto-address Setting in Progress.**

### **1. Error Detection Method**

It is judged an error if a command to start auto address setting comes from another controller during auto address setting.

- This occurs in a system that has more than one outdoor unit and operating lines among the indoor/outdoor units (networked wiring), when an instruction to start auto address setting is given from another controller during the auto address setting process.

### **2. Error Diagnosis**

|                |     |   |
|----------------|-----|---|
| 1 Auto Address | 1-1 | When one controller in a networked system is running auto address setting, it is not possible to start auto address setting from another controller.<br>Wait until the auto address setting in progress finishes. |
|----------------|-----|---|

## E14 Main Unit duplication in Simultaneous-operation Multi Control (detected outdoor unit)

### 1. Error Detection Method

It is judged an error that the main units are duplicated in the indoor unit group.

- Main unit setting was made in the indoor unit group control setting of the remote control detailed settings mode.

### 2. Failure Diagnosis

|                          |     |  |     |     |
|--------------------------|-----|--|-----|-----|
| 1 Group Control Address  | 1-1 | Are multiple indoor units set up as the main unit?                                   | Yes | 2-1 |
|                          |     |  | No  | 2-2 |
| 2 Installation & Setting | 2-1 | Set up only one indoor unit as the main unit and other indoor units to the sub-unit. |     |     |
|                          | 2-2 | Carry out the auto address setting.  |     |     |

## E15 Automatic Address Alarm (The total capacity of indoor units is too low.)

### 1. Error Detection Method

Connecting indoor unit

It is judged an error the total capacity of indoor units replied by communication is lower than that of outdoor unit.

- The total capacity of indoor units is lower than that of outdoor unit.
- Some indoor unit(s) are connected but power is not turned on.
- The CHK pin (CN062/CN071) and/or TEST pin (CN064) of the indoor unit is shorted when its power is turned on.
- High voltage was applied (over AC200V) in the indoor/outdoor operations line circuit.

### 2. Error Diagnosis

|                                 |  |   |     |                    |
|---------------------------------|--|---|-----|--------------------|
| 1 Power Source                  | 1-1  | Is the indoor unit powered off?   | Yes | Power on           |
|                                 |  |   | No  | 2-1                |
| 2 Indoor/outdoor control line   | 2-1  | Is the indoor/outdoor control line opened or shorted?   | Yes | Correct the wiring |
|                                 |  |   | No  | 2-2                |
|                                 | 2-2  | Was a high voltage (over AC200V) applied in the indoor/outdoor operations line circuit?   | Yes | 3-2                |
|                                 |  |   | No  | 3-1                |
| 3 No. of Indoor Units           | 3-1  | Was the number of indoor units changed after auto address setting finished?   | Yes | 3-2                |
|                                 |  |   | No  | 4-1                |
|                                 | 3-2  | Conduct checks prior to auto address setting.   |     |                    |
| 4 Indoor unit control PC board  | 4-1  | Are the CHK pin and TEST pin on the indoor unit control board short-circuited?  | Yes | Remove the short   |
|                                 |  |   | No  | 4-2                |
|                                 | 4-2  | Is the wireless remote controller connected to on the indoor unit's control PC board?   | Yes | 4-3                |
|                                 |  |   | No  | 4-5                |
|                                 | 4-3  | Disconnect the connector mentioned above on the control PC board of the indoor unit control PC board and see whether the E15 goes off after several minutes. (When doing so, if two remote controllers are being used and the wireless remote controller is the main remote controller, set the other remote controller as the main.) | Yes | 4-4                |
|                                 |  |   | No  | 4-5                |
|                                 | 4-4  | Replace wireless remote control parts including wiring.   |     |                    |
| 4-5                             | Is the LED blinking on the indoor unit's control PC board?   | Yes   | 4-6 |                    |
|                                 |  | No  | 5-1 |                    |
| 4-6                             | The nonvolatile memory (EEPROM) on the indoor unit's control board is either not installed, improperly installed or the nonvolatile memory is faulty. Correct this or after replacing the nonvolatile memory, write model data to it in the remote control detailed settings mode. |   |     |                    |
| 5 Outdoor unit control PC board | 5-1  | Check all items under the section "Check Prior to Auto Address Setting".  |     |                    |

- For information on the procedures for replacing the nonvolatile memory (EEPROM) of the indoor unit, refer to the manual that is packaged with the indoor unit service board.
- For information on the remote control's detailed settings, refer to the Reference Materials.

## E16 Automatic Address Alarm (The total capacity of indoor units is too high.)

### 1. Error Detection Method

It is judged an error the total capacity of indoor units is too high or the total number of indoor units is too many.

- The total capacity of indoor units is too high.
- The total number of indoor units is too many.

### 2. Error Diagnosis

|                |     |  |
|----------------|-----|--|
| 1 Auto Address | 1-1 | Check all items under the section "Check Prior to Auto Address Setting". |
|----------------|-----|--|

## E18 Faulty Communication in Group Control Wiring

### 1. Error Detection Method

When the main remote controller cannot communicate with a sub remote controller in the remote control group.

It is judged an error if a sub remote controller in a remote control group fails to communicate with the main remote controller for a period of three minutes.

- An indoor unit within the control group does not have its power on.
- The CHK pin and TEXT pin on the indoor unit in the control group are shorted.
- The DISP pin of an indoor unit sub remote controller in the control group is shorted.
- Remote control group wiring is opened.
- More than one indoor unit in the control group is set to Main.
- An indoor unit in the control group is set to Separate.

### 2. Error Diagnosis

|                                    |   |  |     |                    |
|------------------------------------|---|--|-----|--------------------|
| 1 Indoor Unit                      | 1-1   | Is the indoor unit powered off?  | Yes | Power on           |
|                                    |   |  | No  | 1-2                |
|                                    | 1-2   | Are the CHK pin, TEST pin and DISP pin on the indoor unit control PC board short-circuited?  | Yes | Remove the short   |
|                                    |   |  | No  | 2-1                |
| 2 Substitute Sub Remote Controller | 2-1   | Is the remote control group's wiring opened?   | Yes | Correct the wiring |
|                                    |   |  | No  | 2-2                |
|                                    | 2-2   | Check the group settings (Item Code 14) from the remote control's detailed settings mode. Is the main remote controller (1) set to more than one remote controller or to separate (0)?   | Yes | 2-3                |
|                                    |   |  | No  | 3-1                |
|                                    | 2-3   | Is the wiring of the remote control group wired according to the wiring diagram?   | Yes | 2-4                |
|                                    |   |  | No  | 2-5                |
| 2-4                                | Run the auto address setting again.   |  |     |                    |
| 2-5                                | Run the auto address setting again after correcting the wiring of the remote control group. |  |     |                    |
| 3 Indoor unit control PCB          | 3-1   | Is the wireless remote controller connected to on the indoor unit's control PC board?  | Yes | 3-2                |
|                                    |   |  | No  | 3-4                |
|                                    | 3-2   | Disconnect the connector mentioned above on the control PC board of the indoor unit control PC board, and see whether the E18 goes off after several minutes. (When doing so, if two remote controllers are being used and the wireless remote controller is the main remote controller, set the other remote controller as the main.) | Yes | 3-3                |
|                                    |   |  | No  | 3-4                |
|                                    | 3-3   | Replace wireless remote control parts including wiring.  |     |                    |
| 3-4                                | Replace the indoor unit control PC board.   |  |     |                    |

- For information on the remote control's detailed settings, refer to the Reference Materials.
- For information on the procedures for replacing the Indoor unit control PCB, refer to the manual that is packaged with the indoor unit service board.

**A747931 : Ceiling Type (Type T2)**

**A747938 : Duct Type**

**A747336 : 4-Way Cassette 60 x 60 Type**

## E20 Connection Problem of Indoor/Outdoor Units

### 1. Error Detection Method

The outdoor unit detects an error at following cases during auto address setting.

- Indoor unit is not turned On.
- Indoor/outdoor control line is disconnected and also detects an error in the following cases when the outdoor unit is turned On.
- Address(es) of indoor unit(s) are not assigned correctly.
- Capacity of indoor/outdoor units is mismatched.
- Total number of indoor units is too many.

### 2. Error Diagnosis

|               |     |  |     |                        |
|---------------|-----|--|-----|------------------------|
| 1 Indoor Unit | 1-1 | Are the address(es) of indoor unit(s) assigned correctly?  | Yes | 1-2                    |
|               |     |  | No  | Set its address        |
|               | 1-2 | Are the indoor units turned on?  | Yes | 1-3                    |
|               |     |  | No  | Power on               |
|               | 1-3 | Be sure that the indoor and outdoor units are connected with correct combination written in catalog.   | Yes | 1-4                    |
|               |     |  | No  | Correct the connection |
|               | 1-4 | The indoor/outdoor control line may be disconnected somewhere between the indoor unit(s) and the outdoor unit. Make sure the indoor/outdoor control line is connected. |     |                        |

## F04 Compressor Discharge Temperature Sensor (TD) Trouble

### 1. Error Detection Method

It is judged an error based on the criteria listed below.

- Open circuit or Short circuit

### 2. Error Diagnosis

|                    |     |  |     |                                      |
|--------------------|-----|--|-----|--------------------------------------|
| 1 Sensor           | 1-1 | Sensor connector is connected to PC board properly.                | Yes | 1-2                                  |
|                    |     |  | No  | Reconnect and check                  |
|                    | 1-2 | Sensor is correctly installed at holder side.                      | Yes | Replace sensor                       |
|                    |     |  | No  | Correct and see what happens.<br>1-3 |
|                    | 1-3 | Abnormal temperature exists even after replacing sensor.           | Yes | 2-1                                  |
|                    |     |  | No  | See what happens.                    |
| 2 PC board         | 2-1 | Resistance between connector pins on PC board is less than 1 k ohm | Yes | Replace PC board                     |
|                    |     |  | No  | 2-2                                  |
|                    | 2-2 | Abnormal temperature exists even after replacing PC board.         | Yes | 3-1                                  |
|                    |     |  | No  | See what happens.                    |
| 3 Operating status | 3-1 | Peripheral temperature of outdoor unit is over 46°C.               | Yes | Correct                              |
|                    |     |  | No  | 3-2                                  |
|                    | 3-2 | Tends to have insufficient refrigerant charge in the system.       | Yes | Adjust the amount of refrigerant     |
|                    |     |  | No  | 3-3                                  |
|                    | 3-3 | Check noise.   |     |                                      |

## F06 Inlet Temperature Sensor (C1) in Heat Exchanger Trouble

### 1. Error Detection Method

- In case of open or short

### 2. Error Diagnosis

|                       |     |   |     |                   |
|-----------------------|-----|---|-----|-------------------|
| 1 Sensor Trouble      | 1-1 | Is the connector properly connected to PCB?                     | Yes | 1-2               |
|                       |     |   | No  | Reconnect & check |
|                       | 1-2 | Is the resistor between the sockets infinity or 0Ω?             | Yes | Replace sensor.   |
|                       |     |   | No  | 2-1               |
| 2 Control PCB Failure | 2-1 | Outdoor unit control PCB failure<br>Replace PCB with a new one. |     |                   |

## F07 Intermediate Temperature Sensor (C2) in Heat Exchanger Trouble

### 1. Error Detection Method

It is judged an error when open circuit or short circuit.

### 2. Error Diagnosis

|            |     |   |     |                     |
|------------|-----|---|-----|---------------------|
| 1 Sensor   | 1-1 | Sensor connector is connected to PC board properly.           | Yes | 1-2                 |
|            |     |   | No  | Reconnect and check |
|            | 1-2 | Resistance between sockets is infinity or 0 ohm.              | Yes | Replace sensor      |
|            |     |   | No  | 2-1                 |
| 2 PC board | 2-1 | Replace PC board because of outdoor control PC board failure. |     |                     |

## F08 Outdoor Air Temperature Sensor (TO) Trouble

### 1. Error Detection Method

It is judged an error when open circuit or short circuit.

### 2. Error Diagnosis

|            |     |   |     |                     |
|------------|-----|---|-----|---------------------|
| 1 Sensor   | 1-1 | Sensor connector is connected to PC board properly.           | Yes | 1-2                 |
|            |     |   | No  | Reconnect and check |
|            | 1-2 | Resistance between sockets is infinity or 0 ohm.              | Yes | Replace sensor      |
|            |     |   | No  | 2-1                 |
| 2 PC board | 2-1 | Replace PC board because of outdoor control PC board failure. |     |                     |

## F12 Compressor inlet Suction Temperature Sensor (TS) Trouble

### 1. Error Detection Method

It is judged an error when open circuit or short circuit.

### 2. Error Diagnosis

|                            |     |   |     |                     |
|----------------------------|-----|---|-----|---------------------|
| 1 Sensor                   | 1-1 | Sensor connector is connected to PC board properly.           | Yes | 1-2                 |
|                            |     |   | No  | Reconnect and check |
|                            | 1-2 | Resistance between sockets is infinity or 0 ohm.              | Yes | Replace sensor      |
|                            |     |   | No  | 2-1                 |
| 2 Outdoor control PC board | 2-1 | Replace PC board because of outdoor control PC board failure. |     |                     |

## F31 Outdoor Unit Nonvolatile Memory (EEPROM) Trouble

### 1. Error Detection Method

It is judged an error based on the criteria listed below.

- When power initially turned ON for the first time, nonvolatile memory (EEPROM) is not installed.
- Read values after writing onto nonvolatile memory (EEPROM) is inconsistent.

### 2. Error Diagnosis

|            |  |   |     |                |
|------------|--|---|-----|----------------|
| 1 PC board | 1-1  | Does EEPROM exist on the control PC board?  | Yes | 1-2            |
|            |  |   | No  | Install EEPROM |
|            | 1-2  | Is EEPROM installed properly?<br>(Check: Bent IC pin or incorrect installation, etc.) | Yes | 1-3            |
|            |  |   | No  | Correct        |
| 1-3        | Incorrect EEPROM<br>Replace with correct EEPROM. |   |     |                |

## H01 Primary (input) Overcurrent Detected

### 1. Error Detection Method

- Primary current effective value detected overcurrent (trip current value).

#### (Deluxe Model)

hp = horse power

| Single-phase model |            | 1.5hp | 2.3hp | 2.5hp | 3hp  | 4hp  | 5hp  | 6hp  |
|--------------------|------------|-------|-------|-------|------|------|------|------|
| Trip current value | Heating(A) | 13.0  | 14.0  | 18.5  | 20.0 | 27.0 | 29.0 | 30.0 |
|                    | Cooling(A) | 11.5  | 11.5  | 15.2  | 18.5 | 27.0 | 29.0 | 30.0 |

| 3-phase model      |         | 3hp | 4hp  | 5hp  | 6hp  |

## H02 PAM Trouble (Single-phase only)

### 1. Error Detection Method

- Error is detected by over-voltage and overcurrent of DC side.

### 2. Error Diagnosis

|                   |     |  |     |                              |
|-------------------|-----|--|-----|------------------------------|
| 1 Power supply*   | 1-1 | Not satisfied with $\pm 10\%$ rated supply voltage                       | Yes | Check power supply           |
|                   |     |  | No  | 1-2                          |
|                   | 1-2 | Extreme voltage fluctuations   | Yes | Check power supply           |
|                   |     |  | No  | 1-3                          |
|                   | 1-3 | Extreme distortion of voltage waveform                                   | Yes | Check power supply           |
|                   |     |  | No  | 2-1                          |
| 2 PC board wiring | 2-1 | Loose electrical wire connection   | Yes | Correct connection           |
|                   |     |  | No  | 2-2                          |
|                   | 2-2 | Is HIC PC board connector (CN-PAM) poorly connected or opened with wire? | Yes | Correct connection or wiring |
|                   |     |  | No  | 2-3                          |
|                   | 2-3 | Replace HIC PC board.  |     |                              |

\* Check not only in the outdoor unit stop mode but in the drive mode.

## H03 Primary Current CT Sensor (current sensor) Failure

### 1. Error Detection Method

It is judged an error based on the criteria listed below.

- If 18A or greater is detected when the compressor is stopped (alarm triggered even if the connector is unplugged).
- If no current is detected even though a compressor is running.

### 2. Error Diagnosis

|                              |     |   |     |                   |
|------------------------------|-----|---|-----|-------------------|
| 1 Check the control PC board | 1-1 | Turn the power on again and run the outdoor unit.<br>Is alarm occurred after operation? | Yes | Replace CR board. |
|                              |     |   | No  | See what happens. |

## H05 Sensor Failure, Compressor Discharge Temperature Sensor (TD) Disconnected

### 1. Error Detection Method

- (In case of outdoor temperature over 5°C) For 10 minutes since started, variation of discharge temperature is always detected within 2°C comparing with the temperature just before starting.
- (In case of outdoor temperature less than 5°C) For 30 minutes since started, variation of discharge temperature is always detected within 2°C comparing with the temperature just before starting.

|                  |     |  |     |                      |
|------------------|-----|--|-----|----------------------|
| 1 Sensor Trouble | 1-1 | Is the sensor properly installed at the holder side? | Yes | 1-2                  |
|                  |     |  | No  | Reinstall correctly. |
|                  | 1-2 | Replace the sensor with a new one.                   |     |                      |

## H31 HIC Trouble

### 1. Error Detection Method

It is judged an error if the computer detects an error signal from the HIC.

An error signal is issued by the HIC if abnormal heat occurs inside the HIC or if there is an overcurrent.

However, it is judged an error in the same way if the signal line from the HIC is not connected properly or opened.

- HIC overcurrent due to HIC fault
- HIC abnormal heat caused by defective HIC or HIC radiation error
- Signal line is not connected properly or opened between the HIC and the outdoor CR board.

### 2. Error Diagnosis

|   |     |  |     |   |
|---|-----|--|-----|---|
| 1 Wiring between HIC & outdoor control PC board | 1-1 | The wiring (power cord and signal line) between the HIC and the outdoor CR board is connected properly.  | Yes | 1-2   |
|   |     |  | No  | Correct wiring (connector)                      |
|   | 1-2 | Everything is normal in the wiring (power cord & signal line) between the HIC and the outdoor CR board. Check the wiring one by one with a tester if there is opened and grounding.  | Yes | 3-1 : Single-phase model<br>2-1 : 3-phase model |
|   |     |  | No  | Replace wiring                                  |
| 2 Check the outdoor unit CR PC board            | 2-1 | The connector CN-PRY1 on the CR PC board is connected properly (locked). (3-phase only)  | Yes | 3-1   |
|   |     |  | No  | Correct wiring (connector)                      |
| 3 HIC poor radiation                            | 3-1 | The heat dissipating surface on the back of the HIC is in good contact with the heat sink (heat dissipating fins) of the electrical box. Check for looseness in the fastening screws and the condition of the heat-conducting putty. | Yes | 3-2   |
|   |     |  | No  | Tighten screw(s), add putty                     |
|   | 3-2 | A good flow of cooling air passes through the heat sink (heat dissipating fins) of the electrical box. Check for debris blocking the fins.   | Yes | 4-1   |
|   |     |  | No  | Remove foreign matter                           |
| 4 HIC overcurrent (Compressor failure)          | 4-1 | The results of the pass/fail tests for the following HIC board IPM show it to be outside the range of the resistance of a conforming part.   | Yes | Replace the HIC PC board                        |
|   |     |  | No  | 4-2   |
|   | 4-2 | H31 occurs within 30 seconds when the inverter compressor started.   | Yes | See the alarm code P29.                         |
|   |     |  | No  | See the alarm code P16.                         |

#### • HIC board IPM Pass/Fail Tests

- Measure with an analog tester. (Set to the k ohm range)
- Measure the board by itself. (Remove wires connected from other parts.)
- Measure using IPM terminals.

The resistance values are shown in the table below.

(U-36PE2E5A, U-50PE2E5A, U-60PE2E5A)

(U-60PEY2E5, U-71PEY2E5)

|                        |           |           |           |           |           |           |           |          |
|------------------------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|----------|
| Tester terminals       |           |           |           |           |           |           |           |          |
| +                      | P         |           |           |           | N         |           |           |          |
| -                      | U         | V         | W         | N         | U         | V         | W         | P        |
| Resistance value (ohm) | 1k to 10k | 1k to 10k | 1k to 10k | 5k to 20k | 10k to ∞  | 10k to ∞  | 10k to ∞  | 10k to ∞ |
| Tester terminals       |           |           |           |           |           |           |           |          |
| -                      | P         |           |           |           | N         |           |           |          |
| +                      | U         | V         | W         |           | U         | V         | W         |          |
| Resistance value (ohm) | 10k to ∞  | 10k to ∞  | 10k to ∞  |           | 1k to 10k | 1k to 10k | 1k to 10k |          |

- Excepting the parts of "10 k to ∞", it is acceptable if a small resistance value appears as a reference value unless the value is "0 = short-circuit".

|                        |             |             |             |             |           |           |           |           |

## L04 Outdoor Unit Address Duplication

### 1. Error Detection Method

It is judged an error when the identical self-address communication on the indoor and outdoor wirings is received over 5 times within 3 minutes.

### 2. Error Diagnosis

|                                   |     |  |     |     |
|-----------------------------------|-----|--|-----|-----|
| 1 System address                  | 1-1 | Are other outdoor units using a duplicate setting?   | Yes | 2-1 |
|                                   |     |  | No  | 2-2 |
| 2 Installation or setting related | 2-1 | When units are networked, first set the system address for each outdoor unit in the order 1-2-3 and then run auto address setting. |     |     |
|                                   | 2-2 | Run the auto address setting.  |     |     |

## L10 Outdoor Unit Capacity not Set or Invalid

### 1. Error Detection Method

It is judged an error when outdoor unit capacity not yet setup or systematically unauthorized setting.

### 2. Error Diagnosis

|                                   |     |  |     |                |
|-----------------------------------|-----|--|-----|----------------|
| 1 Check the control PC board      | 1-1 | Was EEPROM replaced when PC board was replaced?  | Yes | 2-1            |
|                                   |     |  | No  | Replace EEPROM |
| 2 Installation or setting related | 2-1 | Set an applicable capacity value on the item code 81 display of maintenance remote controller. |     |                |

- Check : Connect the outdoor maintenance remote controller and check whether item code 81 outdoor capacity value shows "0" or unauthorized capacity is set on the detailed settings mode display of the outdoor EEPROM.  
If the capacity value of the item code 81 with the outdoor maintenance remote controller is incorrect, recorrect and set it again.

\* After setting the capacity value, be sure to reset the power supply switches of both indoor and outdoor units.

## L13 Indoor Unit Type Setting Error

### 1. Error Detection method

- Discordance model(s) between outdoor and indoor units are detected.

|  |     |  |     |                       |
|--|-----|--|-----|-----------------------|
| 1 Discordance Unit                           | 1-1 | Are models for outdoor and indoor units matched respectively?<br>(Ex: Are multiple indoor units connected to commercial outdoor units?)                                | Yes | 2-1                   |
|  |     |  | No  | Replace indoor units. |
| 2 Installation Failure                       | 2-1 | Check the indoor unit's motor valve with the remote control detailed settings mode (2C code) and commercial indoor unit is set to "2" and multiple indoor unit is "0". | Yes | 3-1                   |
|  |     |  | No  | Change installation.  |
| 3 Operating Wires for Indoor & Outdoor Units | 3-1 | Check whether or not indoor and outdoor unit operating wires are short circuit, disconnection, loose connection or earth fault.  |     |                       |

## L18 4-way Valve Operation Failure

### 1. Error Detection Method

It is judged an error when during heating operation (Comp. ON), the highest detected temperature at an outdoor unit heat exchanger (C1) was 20°C or more above the outdoor air temperature (Air Temp.) continuously for 5 minutes or longer.

### 2. Error Diagnosis

|                   |   |  |     |                      |
|-------------------|---|--|-----|----------------------|
| 1 PC board wiring | 1-1   | Is the connector wired from the 4-way valve plugged in the CN-20S connector on the HIC PC board properly?  | Yes | 1-2                  |
|                   |   |  | No  | Correct connector    |
|                   | 1-2   | Has the 4-way valve wiring become opened?  | Yes | Correct wiring       |
|                   |   |  | No  | 1-3                  |
|                   | 1-3   | Is the wire from the coil for controlling the 4-way valve firmly connected to the 4-way valve?   | Yes | 2-1                  |
|                   |   |  | No  | Correct connector    |
| 2 4-way valve     | 2-1   | During heating mode (Comp. ON), insert and remove the connector wired from the 4-way valve into or from CN-20S connector on the HIC PC board. At the same time, does the ON & OFF sounds occur from the 4-way valve? | Yes | 2-2                  |
|                   |   |  | No  | Replace HIC PC board |
|                   | 2-2   | During heating mode (Comp. ON), does the alarm code L18 reproduce for 5 minutes or longer after insertion and removal of CN-20S connector wired from the 4-way valve connector on the HIC PC board?                  | Yes | 2-3                  |
|                   |   |  | No  | See what happens     |
| 2-3               | The parts inside the 4-way valve might have fixed at the cooling side.<br>Replace the 4-way valve |  |     |                      |

## P03 Compressor Discharge Temperature Trouble

### 1. Error Detection Method

- When the discharge temperature is over 106°C.

### 2. Error Diagnosis

|                                    |     |  |     |                                      |
|------------------------------------|-----|--|-----|--------------------------------------|
| 1 Adjustment to refrigerant charge | 1-1 | Not additional refrigerant charged   | Yes | Additional refrigerant charge        |
|                                    |     |  | No  | 2-2                                  |
|                                    | 1-2 | Tends to have insufficient refrigerant charge in the system.   | Yes | Adjust the refrigerant amount        |
|                                    |     |  | No  | Replace CR board                     |
| 2 Blockage in refrigerant circuit  | 2-1 | Service valve inside the outdoor unit closed   | Yes | Open service valve                   |
|                                    |     |  | No  | 2-2                                  |
|                                    | 2-2 | Are the tubes clogged?   | Yes | Avoid clogging                       |
|                                    |     |  | No  | 2-3                                  |
|                                    | 2-3 | Is the outdoor unit's electronic control valve operating correctly?<br>(Check for debris clogging the electronic control valve, a problem with the electrical coil and/or the control PC board.) | Yes | 2-4                                  |
|                                    |     |  | No  | Replace the electronic control valve |
|                                    | 2-4 | Is it observable difference in status of the dew or frost between the strainer's primary and secondary sides?  | Yes | Replace the strainer                 |
|                                    |     |  | No  | Replace CR board                     |

## P04 High Pressure Trouble

### 1. Error Detection Method

It is judged an error if the internal circuit of the high pressure switch is dead.  
 The electronic circuitry of the high pressure switch is cut off if the pressure at the pressure sensor port of the high pressure switch reaches 3.80 MPa. Once it is cut off, it remains cut off until the pressure drops to 3.15 MPa.

- The high pressure switch is malfunctioning.
- Service valve inside the outdoor unit closed
- There is a short air circuit through the outdoor unit's heat exchanger. (when cooling)
- The outdoor unit's fan is broken. (when cooling)
- The outdoor unit's heat exchanger is clogged. (when cooling)
- There is a short air circuit at the indoor unit. (when heating)
- The filter of the indoor unit is clogged. (when heating)
- The fan of the indoor unit is broken or the fan motor is malfunctioning. (when heating)
- The refrigerant circuit is closed and the high pressure is increasing abnormally high. (solenoid valve or expansion valve not activated, a stuck check valve, etc.)
- Refrigerant overcharged.
- Nitrogen or air contaminated in the refrigerant system

### 2. Error Diagnosis

|                                     |   |   |  |   |
|-------------------------------------|---|---|--|---|
| 1 High pressure switch              | 1-1   | The socket of the high pressure switch is securely inserted in the PC board. The wiring is not opened.  | Yes  | 1-2                                       |
|                                     |   |   | No   | Correct connection and/or wiring          |
|                                     | 1-2   | Even if parts near the high pressure switch are shaken quite a lot, the high pressure cutoff will be activated. Even if the covering is in good condition, in several cases vibration has caused wiring inside to open. | Yes  | Replace the high pressure switch (wiring) |
|                                     |   |   | No   | 2-1                                       |
| 2 Service valve                     | 2-1   | Service valve inside the outdoor unit closed  | Yes  | Open the service valve                    |
|                                     |   |   | No   | 2-2                                       |
|                                     | 2-2   | There is an extreme difference in temperature in/out of the service valve.  | Yes  | 2-3                                       |
|                                     |   |   | No   | 3-1                                       |
| 2-3                                 | Check the flare connection, someone may have forgotten to remove the bonnet. If there is a problem within the service valve, replace the valve. |   |  |   |
| 3 Problem around the heat exchanger | 3-1   | While cooling is operating an alarm is occurred.  | Yes  | 3-2                                       |
|                                     |   |   | No   | 3-5                                       |
|                                     | 3-2   | The intake temperature (ambient temperature) of the outdoor unit's heat exchanger is above 46°C.  | Yes  | Prevent air short circuit                 |
|                                     |   |   | No   | 3-3                                       |
|                                     | 3-3   | The outdoor unit's heat exchanger is clogged.   | Yes  | Clean the heat exchanger                  |
|                                     |   |   | No   | 3-4                                       |
|                                     | 3-4   | Check whether the outdoor unit fan is normal or if the sockets are firmly pressed onto the plugs on the outdoor PC board, as well as if any wiring is opened. Are these checking finished without fail?                 | Yes  | 4-1                                       |
| No                                  |   |   | Replace the outdoor unit fan. Correct connection and/or wiring |   |
| 3-5                                 | While heating is operating an alarm is occurred.  | Yes   | 3-6  |   |
|                                     |   | No  | 4-1  |   |

|                                       |   |  |     |   |
|---------------------------------------|---|--|-----|---|
| 3 Problem around the heat exchanger   | 3-6   | The intake temperature (ambient temperature) of the indoor unit is above 36°C.   | Yes | Prevent air short circuit                                   |
|                                       |   |  | No  | 3-7   |
|                                       | 3-7   | The filter of the indoor unit is clogged.  | Yes | Clean the filter  |
|                                       |   |  | No  | 3-8   |
|                                       | 3-8   | The fan of the indoor unit is broken or the fan motor is faulty.   | Yes | Replace the indoor fan (motor)                              |
|                                       |   |  | No  | 4-1   |
| 4 Blockage in the refrigerant circuit | 4-1   | Is the outdoor unit's electronic control valve operating correctly? (Check for debris clogging the electronic control valve, a problem with the electrical coil and/or the control PC board.)  | Yes | 4-3   |
|                                       |   |  | No  | Repair the electronic control valve of the outdoor unit     |
|                                       | 4-2   | The indoor unit's expansion valve is operating correctly. (check for debris clogging the valve, a problem with the electrical coil and/or the control PC board)  | Yes | 4-3   |
|                                       |   |  | No  | Repair the expansion valve of the indoor unit               |
|                                       | 4-3   | If an alarm is occurred with the high pressure below 3.80 MPa, with the pressure measured as displayed by the manifold gauge, check the check valve in the compressor discharge line. Are these checking finished without fail?  | Yes | 4-4   |
|                                       |   |  | No  | Replace the check valve in the compressor discharge line    |
|                                       | 4-4   | The electronic control valve is faulty. In systems where the solenoid valve kits and the ice thermal storage tank are connected, check these solenoid valves.  | Yes | Replace the electronic control valve and/or solenoid valve. |
|                                       |   |  | No  | 5-1   |
| 5 Overcharging                        | 5-1   | Error occurs when the system is operating in cooling mode.   | Yes | 5-3   |
|                                       |   |  | No  | 5-2   |
|                                       | 5-2   | Error occurs when the system is operating in heating mode.   | Yes | 5-4   |
|                                       |   |  | No  | 5-5   |
|                                       | 5-3   | An alarm is occurred with the high pressure at 3.80 MPa, with the pressure measured either as displayed by the monitoring software or with a manifold gauge, at which time the temperature of liquid in the outdoor unit's heat exchanger is detected to be at the temperature of the outside air. | Yes | 5-5   |
|                                       |   |  | No  | Contact the service representative                          |
|                                       | 5-4   | An alarm is occurred with the high pressure at 3.80 MPa, with the pressure measured either as displayed by the monitoring software or with a manifold gauge, at which time the temperature of liquid in the indoor heat exchanger is detected to be at room temperature (intake temperature).      | Yes | 5-5   |
|                                       |   |  | No  | Contact the service representative                          |
| 5-5                                   | The system may be overcharged. Check how much refrigerant was added during installation. When a system is inspected for airtightness, it is seldom that enough nitrogen has been expelled, so some remains in the circuit. In this case, it is necessary to collect the refrigerant and then recharge the system. |  |     |   |

## P05 AC Power Supply Trouble

### 1. Error Detection Method

- Instantaneous blackout
- Zero-cross (waveform input of power supply) error
- DC voltage charge failure

### 2. Error Diagnosis

Note : The work involved in diagnosing each of the items is extremely dangerous, so turn the power off at the breaker before performing the tests.

|                                       |   |   |   |   |
|---------------------------------------|---|---|---|---|
| 1 Check the power supply & the wiring | 1-1   | Is the voltage on each of the terminal boards within $\pm 10\%$ of the rated voltage?           | Yes   | 1-4 : Single-phase model<br>1-2 : 3-phase model   |
|                                       |   |   | No  | Check for open circuit and the voltage at the breaker. if a problem is found, fix it and check again. |
|                                       | 1-2   | Power wiring N-phase is connected.  | Yes   | Correct wiring  |
|                                       |   |   | No  | 1-3   |
| 1-3                                   | Power wiring L2 and N are reverse connected. (3-phase only)           | Yes   | Correct wiring                                  |   |
|                                       |   | No  | 1-4   |   |
| 1-4                                   | Turn the power back on and check again. Is the alarm triggered again? | Yes   | 3-1 : Single-phase model<br>2-1 : 3-phase model |   |
|                                       |   | No  | 4-1   |   |
| 2 Check the outdoor unit CR PC board  | 2-1   | The connector CN-PRY2 on the outdoor CR PC board is connected properly (locked). (3-phase only) | Yes   | 3-1   |
|                                       |   |   | No  | Correct wiring (connector)  |
| 3 Check the outdoor unit HIC PC board | 3-1   | Are the wires (RE1, RE2) from the reactor firmly installed?                                     | Yes   | 3-2   |
|                                       |   |   | No  | Correct wiring  |
|                                       | 3-2   | Turn the power back on and check again. Is the alarm triggered again?                           | Yes   | Replace the outdoor unit HIC PC board.  |
|                                       |   |   | No  | 4-1   |
| 4 Final check                         | 4-1   | There may be a instantaneous blackout failure. If there is nothing abnormal, see what happens.  |   |   |

Single-phase outdoor unit HIC PC board

\* Common in RE1 and RE2  
4hp : Plug-in type  
5hp, 6hp : Fastening screw type

3-phase outdoor unit HIC PC board

(for 3-phase outdoor unit CR PC board)

## P13 Alarm Valve Open

### 1. Error Detection Method

Detection is performed only in the test run. When once detected or the test run finished without any error, the second detection will not be done.

In case of forgetting to open a valve, P04 (high-pressure switch operational alarm) is occasionally preceded due to the following conditions.

- The status of small temperature change of the operating indoor unit continues for the first 7 minutes since the cooling test run has started.

### 2. Error Diagnosis

|                                    |   |  |     |                                      |
|------------------------------------|---|--|-----|--------------------------------------|
| 1 Service valve                    | 1-1   | Service valve inside the outdoor unit closed   | Yes | Open the service valve               |
|                                    |   |  | No  | 2-1                                  |
| 2 Adjustment to refrigerant change | 2-1   | Not additional refrigerant charged   | Yes | Additional refrigerant charge        |
|                                    |   |  | No  | 3-1                                  |
| 3 Blockage in refrigerant circuit  | 3-1   | Are the tubes clogged?   | Yes | Avoid clogging                       |
|                                    |   |  | No  | 3-2                                  |
|                                    | 3-2   | Is the outdoor unit's electronic control valve operating correctly?<br>(Check for debris clogging the electronic control valve, a problem with the electrical coil and/or the control PC board.) | Yes | 3-3                                  |
|                                    |   |  | No  | Replace the electronic control valve |
| 3-3                                | As the second detection is not done, restart and see what happens if there is no error. |  |     |                                      |

## P14 O<sub>2</sub> Sensor Detect

### 1. Error Detection Method

- It is judged an error whenever the outdoor unit receives the signal "O<sub>2</sub> Alarm Occurred" from the indoor unit.
- With the indoor unit's EEPROM setting (item code 0B) set to 0001, the EXCT input was shorted.

### 2. Error Diagnosis

|                                  |     |  |     |                                   |
|----------------------------------|-----|--|-----|-----------------------------------|
| 1 System configuration           | 1-1 | Is an O <sub>2</sub> sensor being used?  | Yes | 3-1                               |
|                                  |     |  | No  | 2-1                               |
| 2 Indoor unit's EEPROM setting   | 2-1 | Is the indoor EEPROM setting, item code 0B, on the indoor unit's control PC board set to 0001?   | Yes | After correcting the setting, 3-1 |
|                                  |     |  | No  | 4-1                               |
| 3 Indoor EXCT wiring             | 3-1 | Is the indoor EXCT socket (wire) shorted?  | Yes | Correct wiring                    |
|                                  |     |  | No  | 4-1                               |
| 4 Indoor unit's control PC board | 4-1 | Is the alarm triggered if the indoor EXCT socket (wire) is disconnected, and the power is reset? | Yes | 4-3                               |
|                                  |     |  | No  | 4-2                               |
|                                  | 4-2 | Since there is no error, see what happens.   |     |                                   |
|                                  | 4-3 | Indoor unit control PC board error → replace PC board.   |     |                                   |

## P15 Insufficient Gas Level Detected

### 1. Abnormal Detection Method

Alarm occurs in the following cases:

- Compressor's current value shows lower than a certain value.
- Compressor's discharge temperature exceeds 95°C.
- Electronic expansion valve is fully opened.
- The difference between indoor unit heat exchanger temperature and intake temperature is less than 4K.

### 2. Error Diagnosis

|                                    |     |  |     |                                       |
|------------------------------------|-----|--|-----|---------------------------------------|
| 1 Adjustment of refrigerant amount | 1-1 | Insufficient gas level<br>(Check whether or not pressure level is normal.) | Yes | Recharge with additional refrigerant. |
|                                    |     |  | No  | 1-2                                   |
|                                    | 1-2 | Check leakage of refrigeration (leak test)                                 | Yes | Replace leaking part with a new one.  |
|                                    |     |  | No  | See what happens.                     |

## P16 Compressor Overcurrent Trouble

### 1. Meaning of Alarm

#### Secondary current effective value detected the overcurrent (trip current value)

##### (Deluxe Model)

Single phase model(1.5hp-2.5hp):Trip current=12.0A

Single phase model(3hp):Trip current=23.0A

Single phase model(4hp-6hp):Trip current=27.0A

3 phase model(3hp):Trip current=12.0A

3 phase model(4hp-6hp):Trip current=17.0A

##### (Standard Model)

Single phase model(2.5hp-3hp):Trip current=12.0A

Single phase model(4hp):Trip current=20.0A

Single phase model(5hp):Trip current=27.0A

3 phase model(4hp):Trip current=12.0A

3 phase model(5hp-6hp):Trip current=17.0A

#### Secondary current instantly value detected the overcurrent (trip current value)

##### (Deluxe Model)

Single phase model(1.5hp-2.5hp):Trip current=18.9Apeak

Single phase model(3hp):Trip current=28.0Apeak

Single phase model(4hp-6hp):Trip current=45.0Apeak

3 phase model(3hp):Trip current=24.0Apeak

3 phase model(4hp-6hp):Trip current=27.0Apeak

##### (Standard Model)

Single phase model(2.5hp-3hp):Trip current=18.9Apeak

Single phase model(4hp):Trip current=28.0Apeak

Single phase model(5hp):Trip current=45.0Apeak

3 phase model(4hp):Trip current=17.0Apeak

3 phase model(5hp-6hp):Trip current=27.0Apeak

### 2. Check of content

|                    |     |   |     |   |
|--------------------|-----|---|-----|---|
| 0 Multiple factors | 0-1 | Replaced the compressor (added oil, if it was necessary) but it occurred again immediately.   | Yes | 7-1   |
|                    |     |   | No  | -   |
|                    | 0-2 | Replaced the board, but it occurred again immediately.  | Yes | Replace compressor along with adding oil, then recheck from 1-1 |
|                    |     |   | No  | -   |
| 1 Power Source     | 1-1 | Power cord connections are loose.   | Yes | Correct the wiring  |
|                    |     |   | No  | 1-2   |
|                    | 1-2 | Rated power voltage is not within $\pm 10\%$ .  | Yes | Test the power supply   |
|                    |     |   | No  | 1-3   |
|                    | 1-3 | Extreme fluctuations in voltage.  | Yes | Test the power supply   |
|                    |     |   | No  | 1-4   |
|                    | 1-4 | An open phase state is observed.  | Yes | Test the power supply   |
|                    |     |   | No  | 2-1   |
| 2 Board wiring     | 2-1 | Disconnected parts, miswiring and/or poor connections (loose) are observed in the connections on the CR board and/or in the connections of components that are connected by wiring from the CR board. | Yes | Correct   |
|                    |     |   | No  | 2-2   |
|                    | 2-2 | Disconnected parts, miswiring and/or poor connections (loose) are observed in the connections of outdoor board(s) that are connected by wiring from the CR board.                                     | Yes | Correct   |
|                    |     |   | No  | 2-3   |
|                    | 2-3 | Disconnected parts, miswiring and/or poor connections (loose) are observed in the connections of outdoor board(s) that are connected by wiring from the HIC board.                                    | Yes | Correct   |
|                    |     |   | No  | 2-4   |
|                    | 2-4 | Disconnected parts, miswiring and/or poor connections (loose) are observed in the connections of HIC boards connected by wiring from the CR board.  | Yes | Correct   |
|                    |     |   | No  | 2-5   |
|                    | 2-5 | Disconnected parts, miswiring and/or poor connections (loose) are observed in the connections of HIC board(s) that are connected by wiring from the outdoor board.                                    | Yes | Correct   |
|                    |     |   | No  | 2-6   |

|                        |  |   |                                  |  |
|------------------------|--|---|----------------------------------|--|
|                        | 2-6  | Disconnected parts, miswiring and/or poor connections (loose) are observed in the connections of HIC board(s) that are connected by wiring to a compressor. | Yes                              | Correct  |
|                        |  |   | No                               | 3-1  |
| 3 Compressor wiring    | 3-1  | Disconnections and/or miswiring are observed in the connecting location of the compressor terminals.  | Yes                              | Correct  |
|                        |  |   | No                               | 3-2  |
|                        | 3-2  | Conditions such as burned terminal covers and/or discolored terminals are observed in the connecting location of the compressor terminals.                  | Yes                              | Eliminate looseness by changing the terminals, or crimping the terminals again.              |
|                        |  |   | No                               | 4-1  |
| 4 Check the situation  | 4-1  | Outdoor air intake temperature is high.   | Yes                              | Take measures  |
|                        |  |   | No                               | 4-2  |
|                        | 4-2  | May be caused by poor outdoor unit air flow (dirty or clogged heat exchanger, blocked discharge port, etc.)   | Yes                              | Correct  |
|                        |  |   | No                               | 4-3  |
|                        | 4-3  | Air short circuit has occurred. This is a phenomenon when discharged air (exhaust heat) from the outdoor unit is drawn back into the suction vent.          | Yes                              | Prevent air short circuit  |
|                        |  |   | No                               | 4-4  |
|                        | 4-4  | Indoor air intake temperature is high.  | Yes                              | Take measures  |
|                        |  |   | No                               | 4-5  |
| 4-5                    | The filter of the indoor unit is clogged.  | Yes   | Clean the filter                 |  |
|                        |  | No  | 4-6                              |  |
| 4-6                    | Air short circuit has occurred. This is a phenomenon when discharged air (exhaust heat) from the indoor unit is drawn back into the suction vent.                              | Yes   | Prevent air short circuit        |  |
|                        |  | No  | 5-1                              |  |
| 5 Check operation      | 5-1  | Possible to operate.  | Yes                              | 5-2  |
|                        |  |   | No                               | 6-1  |
|                        | 5-2  | Operating pressure is affected by pressure overload.  | Yes                              | 5-3  |
|                        |  |   | No                               | 5-4  |
|                        | 5-3  | Tends to have an overcharge of refrigerant in the system.   | Yes                              | Adjust the amount of refrigerant   |
|                        |  |   | No                               | 5-4  |
|                        | 5-4  | Tends to operate for a long time turning gas back into liquid.  | Yes                              | Check the operation of functional parts  |
|                        |  |   | No                               | 5-5  |
| 5-5                    | Tends to have insufficient refrigerant charge in the system.   | Yes   | Adjust the amount of refrigerant |  |
|                        |  | No  | 5-6                              |  |
| 5-6                    | Even though the high pressure saturation temperature is 43°C or less, the secondary current of the inverter is high. (The frequency (Hz) ends up dropping due to the current.) | Yes   | Replace the compressor           |  |
|                        |  | No  | See what happens.                |  |
| 6 Check history        | 6-1  | Dividing the outdoor EEPROM INV operation time by the number of times oil was supplied to the system yields 3 hours or less.                                | Yes                              | 6-2  |
|                        |  |   | No                               | 6-2  |
|                        | 6-2  | There is a history of H31 in the pre-trip counter of the outdoor EEPROM alarm history.  | Yes                              | Replace the compressor and add oil. However if 6-1 was "no," it is not necessary to add oil. |
|                        |  | No  | 7-1                              |  |
| 7 Check the HIC boards | 7-1  | The results of HIC board IPM Pass/Fail Tests show the outside the range of the resistance of a conforming part listed in the next page.                     | Yes                              | Replace HIC board  |
|                        |  |   | No                               | 8-1  |

- (Check content of 7) The test check of the HIC board is only a check on the output level, so the input stage may not be working.
- With the filter board broken, alarm P16 may not be triggered.

• **HIC board IPM Pass/Fail Tests**

- Measure with an analog tester. (Set to the k ohm range.)
- Measure the board by itself. (Remove wires connected from other parts.)
- Measure using IPM terminals.

★ **Conforming part resistance value (measure with an analog tester)**

- Excepting the parts of "100 k to ∞", it is acceptable if a small resistance value appears as a reference value unless the value is "0 = short-circuit".

## P22 Outdoor Unit Fan Motor Trouble

### 1. Error Detection Method

- It is judged an error when the outdoor fan motor's rotating signal cannot be detected normally.

### 2. Error Diagnosis

|                            |     |   |     |                                   |
|----------------------------|-----|---|-----|-----------------------------------|
| 1 Wiring                   | 1-1 | Are the connectors "CN-FMA", "CN-FMB", "CN-FM1", and "CN-FM2", "CN-FM" firmly connected to the outdoor control PC board (lock engaged)?   | Yes | 2-1                               |
|                            |     |   | No  | Correct the connector connections |
| 2 Outdoor fan motor        | 2-1 | Disconnect the connectors "CN-FMA", "CN-FMB", "CN-FM1", and "CN-FM2", "CN-FM" from the outdoor control PC board and the outdoor fan by hand; does it rotate freely? rotate (Check the outdoor fan motor lock) | Yes | 3-1                               |
|                            |     |   | No  | Replace the outdoor fan motor     |
| 3 Outdoor control PC board | 3-1 | Turn the power on and run the unit again; is P22 triggered again? Or can you see or hear anything that is obviously wrong in its rotation?  | Yes | 3-2                               |
|                            |     |   | No  | 3-3                               |
|                            | 3-2 | Replace the outdoor control PC board. (If it fails to operate normally even after replacing the outdoor control PC board, replace the outdoor fan motor.)   |     |                                   |
|                            | 3-3 | If there is nothing particularly out of the ordinary, see what happens.   |     |                                   |

**P29 Lack of INV compressor wiring, INV compressor actuation failure (including locked), DCCT failure**

**U-36PE2E5A, U-50PE2E5A, U-60PE2E5A  
U-60PEY2E5, U71PEY2E5**

**1. Error Detection Method**

- Abnormal current is detected at DCCT before start-up.
- Start-up failed during overcurrent and/or step-out detected.
- Open-wire of compressor and/or backspin detected.
- Secondary current is not detected during INV compressor is running.

**2. Error Diagnosis**

|                               |     |  |                                |  |
|-------------------------------|-----|--|--------------------------------|--|

## 5-4. Inspection of Parts (Outdoor Unit)

### (1) Electronic control valve (MOV1)

- MOV1: Measure the voltage between plug pin 5 and pins 1 through 4 at the CN-MOV1 connector (5P, white) on the outdoor unit control PCB. (Because of the pulse output, a simplified measurement method is used. Set the tester to the 12 V range; if the value displayed is approximately 4 V, then the voltage is normal.)  
If the voltage is normal, measure the resistance between connector pin 5 and pins 1 through 4.  
Resistance between pin 5 and pins 1 through 4 should be approximately  $46\ \Omega$  for all. (If the result is  $0\ \Omega$  or,  $\infty$  then replace the coil.)

## 5-5. Symptom: Thermostat in OFF continues or cycles OFF & ON too frequently

### 1. How to detect abnormality

- Abnormality does not occur. Protective function can be checked when the outdoor maintenance remote controller is connected.

### 2. Error Diagnosis

|                            |                    |   |                |  |
|----------------------------|--------------------|---|----------------|--|
| 1 Indoor control PC board  | 1-1                | Setting temperature reaches the level set ON thermostat. Setting temperature is too low in heating mode and too high in cooling and dry mode.   | Yes            | Adjust setting temperature                 |
|                            |                    |   | No             | 1-2  |
|                            | 1-2                | Check if the sensors are connected correctly. Are all connection made properly? Room temp. (TA) in yellow, heat exchanger (E1) in red, heat exchanger (E2) in black, heat exchanger (E3) in brown, air outlet (BL) in green | Yes            | Connect correctly                          |
|                            |                    |   | No             | 1-3  |
|                            | 1-3                | DISP (display mode) is applied.   | Yes            | Turn OFF(OPEN)                             |
|                            |                    |   | No             | 1-4  |
|                            | 1-4                | With a thermostat OFF in heating mode, wind speed (item code 05) is out of range 0 - 6. (Use Simple Setting Function on standard timer remote controller.)  | Yes            | Choose one of 0 to 6                       |
|                            |                    |   | No             | 1-5  |
|                            | 1-5                | DEMAND is applied.  | Yes            | Turn OFF(OPEN)                             |
|                            |                    |   | No             | 2-1  |
| 2 Outdoor control PC board | 2-1                | Outdoor unit and protective function of a system are operating. (Connect outdoor maintenance remote controller to RC socket on outdoor unit main control PC board and check alarm messages.)                                | Yes            | See operational status                     |
|                            |                    |   | No             | 2-2  |
|                            | 2-2                | Discharge temperature is over 80°C in stop mode and does not decrease. (Connect outdoor maintenance remote controller to RC socket on outdoor unit main control PC board and check alarm messages.)                         | Yes            | Replace discharge temperature sensor       |
|                            |                    |   | No             | 2-3  |
|                            | 2-3                | Demand value always stays low. (The value is lower than 70. Excluding -1 (unlimited))(Connect outdoor maintenance remote controller to RC socket on outdoor unit main control PC board and check alarm messages.)           | Yes            | Increase values (over 70)                  |
|                            |                    |   | No             | 2-4  |
| 2-4                        | DEMAND is applied. | Yes   | Turn OFF(OPEN) |  |
| 3 Control equipment        | 3-1                | Demand setting is made by control units (P-AIMS, Seri-Para I/O unit for outdoor unit, Seri-Para I/O each indoor unit.)  | Yes            | Turn OFF                                   |
|                            |                    |   | No             | 4-1  |
| 4 System                   | 4-1                | When operating in cooling (including auto cooling & heating) and dry mode, lowest temp. of indoor E1, E2 and E3 sensor is less than 2°C (under anti-freeze control).  | Yes            | Wait until more than 2°C reaches           |
|                            |                    |   | No             | 4-2  |
|                            | 4-2                | During defrosting operation   | Yes            | Wait for a few minutes to 10 minutes or so |
|                            |                    |   | No             | 4-3  |
|                            | 4-3                | Outdoor unit PC board failure → Replacement   |                |  |

- According to a type of model, the indoor sensors will not be supplied in some cases.
- According to a type of model, the outdoor DEMAND will not be supplied in some cases.
- When LINE Checker is used, the temperature sensors can be observed (display, record) simultaneously.
- According to some areas, some of the models are unreleased.

## 5-6. How to Clean Heat Exchanger

1. Turn off the power supply.

### WARNING

**ELECTRICAL SHOCK CAN CAUSE SEVERE PERSONAL INJURY OR DEATH.**

**Fig. 5-1**

2. Remove the lid (drain pump). (Fig. 5-1)
3. Remove the drain plug and drain the water from the drain pan. (Fig. 5-1)
4. Insert a high pressure cleaner from the opening (Fig. 5-2a) and clean the heat exchanger. (Fig. 5-2b)

**Fig. 5-2a**

**Fig. 5-2b**

5. When finished cleaning, install the drain plug and lid (drain pump).

## 5-7. How to Replace Fan Motor

### Removing Fan Motor

1. Turn off the power supply.

**WARNING**

**ELECTRICAL SHOCK CAN CAUSE SEVERE PERSONAL INJURY OR DEATH.**

**Fig. 5-3**

2. Remove the lid of the electrical component box. (Screws x 5 locations: Fig. 5-3)  
Make sure the PC board should not be electrified. Power supply LED should be lit off on PC board. (Fig. 5-4)

**Fig. 5-4**

3. Disconnect the interconnector in the middle of the wiring to the fan motor. (Fig. 5-5)

4. Remove the bottom plate. (Fig. 5-6)

**Fig. 5-6**

5. Disconnect two (2) clutches (Fig. 5-7a) fixing the lower side of the fan casing and pull out the protrusion part (Fig. 5-7c) placed onto the side of the main unit (Fig. 5-7b). Then remove the fan casing.

**Fig. 5-7a**

**Fig. 5-7c**

**Fig. 5-7b**

6. Remove the screws (M6 x2 locations: Fig. 5-8) fixing the fan motor. It is recommended that a nutdriver (8mm) be used.

7. Remove the bracket (Fig. 5-8) and then remove the fan and fan motor (Fig. 5-9).

8. Loosen the fixed screw with a hexagon wrench (3mm, over 100mm in length) and remove the fan.

9. Remove the rubber attached to the wiring of the fan motor (Fig. 5-11).

### Installing Fan Motor

1. For installation, reverse the procedure above.
2. Fine tune so that the fan can be positioned in the center of the fan casing.

## 6. OUTDOOR UNIT MAINTENANCE REMOTE CONTROLLER

|      |   |      |
|------|---|------|
| 6-1. | Overview .....  | 6-2  |
| 6-2. | Functions.....  | 6-2  |
| 6-3. | Normal Display Operations and Functions .....   | 6-3  |
| 6-4. | Monitoring Operations: Display of Indoor Unit and Outdoor Unit Sensor<br>Temperatures ..... | 6-8  |
| 6-5. | Monitoring the Outdoor Unit Alarm History: Display of Outdoor Unit<br>Alarm History .....   | 6-10 |
| 6-6. | Settings Modes: Setting the Outdoor Unit EEPROM.....  | 6-11 |

## 6-1. Overview

### What is the outdoor unit maintenance remote controller?

Beginning with the DC-INV series of outdoor units, nonvolatile memory (EEPROM) is used in the outdoor unit PCB. In this way, the setting switches that were located on earlier PCBs have been converted to EEPROM data. This remote controller is an outdoor unit maintenance tool that is used to make and change the EEPROM settings.

This remote controller can be used for checking the outdoor unit EEPROM settings and contents, and also can be used to monitor the outdoor unit alarm history and indoor/outdoor unit temperatures, and to check the status of the indoor unit connections (No. of units, operating status, etc.).

**Note:** Because this tool does not function as a remote controller, it is used only during test runs and servicing.

CZ-RTC4

### System diagram

- \* The special service checker wiring is required in order to connect the outdoor unit maintenance remote controller to the outdoor unit PCB.
- \* Even when the outdoor unit maintenance remote controller is connected, a separate remote controller or other control device must be connected to the indoor unit.

## 6-2. Functions

### ■ Normal display functions

(1) Functions: Button operations can be used to perform the following functions.

- Start/stop of all indoor units
- Switching between cooling and heating
- Test run of all indoor units
- High-speed operation of indoor units (Do not use with actual units. This may damage the devices.)

(2) Display: The following can be displayed.

- Alarm details display
- No. of indoor/outdoor units
- Unit Nos. of connected indoor/outdoor units
- Indoor/outdoor unit operating status (blinks when an alarm occurs)
- Indoor unit thermostat ON
- Individual display of outdoor unit alarms
- Outdoor unit compressor total operating time
- Outdoor unit total power ON time
- Outdoor unit microcomputer version
- Other

### ■ Temperature monitor

- Displays the indoor/outdoor unit sensor temperatures.

### ■ Outdoor unit alarm history monitor

- Displays the outdoor unit alarm history.

### ■ Setting modes

- Setting mode 1 and setting mode 2 are used to make the outdoor EEPROM setting.

## 6-3. Normal Display Operations and Functions

### ■ Normal display functions

- Connect the special service checker wiring to the outdoor unit PCB. The connection is shown in the figure below.

When connecting the special service checker wiring to the remote controller CZ-RTC4, cut out the wire as shown in the figure below because the connector of the remote controller cannot be used directly.

- \* It is not necessary to disconnect the communications line in the inter-unit control wiring if it has already been connected at this time.
- \* Setting modes 1 and 2 can be used even when the outdoor unit is independent (when 1 maintenance remote controller is connected to 1 outdoor unit and automatic address setting for the indoor units has not been completed).
- \* Displays the overall system status for that refrigerant system.

- **All units start/stop (Fig. 6-1)**

<Operation>

The  (Start/Stop operation) button can be used to start and stop all the indoor units.

- The LED illuminates if any indoor units is operating.
- The LED blinks if an alarm at any of the operating indoor units occurs.

- **Cooling/heating change (Fig. 6-1)**

### NOTE

Cooling and heating mode changes are only available when all indoor units are stopped.

<Operation>

The  (Mode) button can be used to change between heating and cooling operation.

- The display indicates the operating mode of the indoor unit with the lowest unit No.

- **All units test run (Fig. 6-2)**

<Operation>

The  (Check) button can be used to start and stop a test run for all indoor units.

- Press and hold for 4 seconds to turn ON.  
During the test run “TEST” is displayed.
- The status of test runs performed from the indoor unit remote controller is not displayed on the outdoor unit maintenance remote controller.

- **Double-speed (Fig. 6-3)**

- Do not use for actual operation.  
(Doing so may damage the devices.)

<Operation>

The timer button  can be used to change between double-speed and normal operation.

- During double-speed operation, the Sleeping Mode  mark is displayed.

Fig. 6-1

Fig. 6-2

Fig. 6-3

■ **Display (functions)**

- Use the temperature setting  and  buttons to change the item code.

| Item code | Display contents  | Remarks                   |
|-----------|---|---------------------------|
| 00(1)     | Outdoor unit contents (code) : OFF when normal<br>Blinking 8 - alarm code display at pre-trip,LED (2) | At initial status         |
| 01        | No. of indoor units connected in that refrigerant system  |                           |
| 02        | Unit Nos. of connected indoor units in that refrigerant system  |                           |
| 03        | Operating status of indoor units in that refrigerant system (blinks when alarms occur)                |                           |
| 04        | Unit Nos. of indoor units in that refrigerant system where the thermostats are ON                     |                           |
| 05        | No. of outdoor units connected in that refrigerant system   | No. of connected units :1 |
| 06        | Unit Nos. of connected outdoor units in that refrigerant system                                       |                           |
| 07        | Operating status of outdoor units in that refrigerant system (blinks when alarms occur)               |                           |

(1) and (2) correspond to Fig. 6-4 on the next page.

(3) XX-YY R.C.

Displays the outdoor unit sub-bus address which is currently selected.

XX = Outdoor system address on main bus line (1 – 30)

YY = Outdoor unit sub-bus address (1 – 8)

“1” appears when there is only 1 outdoor unit.

Locations where (1), (2), and (3) are displayed as shown in Fig. 6-4.

Fig. 6-4

<Sample displays>

01: <No. of connected indoor units>  
4 units connected

Fig. 6-5

02: <Unit Nos. 1, 2, 3, and 4 are connected>

Fig. 6-6

■ 7-segment, 4-digit display for remote controller timer display

The connected unit Nos. are displayed as shown below, using the 7-segment 4-digit (00:00) display and the colon.

● Display for unit Nos. 1 – 20

● Display for unit Nos. 21 – 40

● The meaning of the colon display changes in the same way, allowing unit Nos. up to 80 to be displayed.

● Sample displays of the unit Nos. of connected indoor units

**NOTE**

The change of the colon display (between unit Nos. 1-20 to unit Nos. 21-40) occurs automatically every 10 seconds. (However the display does not change if there are no higher-number units connected.) To change the display to the higher-number units before 10 seconds have passed, press the (Flap) button.

■ The total compressor operating time is displayed (in 1-hour units) using 8 digits.

- When the first 4 digits are displayed, the top dot of the colon is illuminated. (Figure (A))
- When the last 4 digits are displayed, the colon dot is OFF. (Figure (B))
- The display of the first 4 digits and last 4 digits changes automatically after 10 seconds. The display can also be changed by pressing the (Flap) button.

10: <Compressor's total operating time>  
(A) and (B) are displayed alternately.  
(The example here (0000, 0062) indicates 62 hours.)

**NOTE**

With the outdoor unit maintenance remote controller (when connected to the outdoor unit), the unit remote controller check functions will not operate.

## 6-4. Monitoring Operations: Display of Indoor Unit and Outdoor Unit Sensor Temperatures

<Operating procedure>

- (1) Press and hold the  (Check) button and  buttons simultaneously for 4 seconds or longer to engage temperature monitor mode.

During temperature monitoring,  is illuminated.

(The display and operations are the same as for monitor mode using the indoor unit remote controller.)

- (2) Press the  button and select the indoor unit to monitor.

- (3) Press the temperature setting  and  buttons and select the item code of the temperature to monitor.

The unit No. of the selected indoor unit, and the temperature data, are displayed.

- (4) To end monitoring, press the  (Check) button.  
The display returns to the normal display.

**NOTE** The display does not blink.

■ Display of unit No. 1 (main unit)

|                  | Item code         | Meaning of Code                        |
|------------------|-------------------|--|
| Indoor unit data | 02                | Indoor unit intake temp.               |
|                  | 03                | Indoor unit heat exchanger temp. (E1)  |
|                  | 04                | Indoor unit heat exchanger temp. (E2)  |
|                  | 05                | —                                      |

| 10               |                   | —                                      |
| 11               |                   | Outdoor air temp. (TO)                 |
| 12               |                   | —                                      |
| 13               |                   | Inverter primary current               |
| 14               |                   | —                                      |
| 15               |                   | Outdoor MV value                       |
| 16               |                   | —                                      |
| 19               | Frequency         |  |

\* Depending on the model, some items may not be displayed.

## 6-5. Monitoring the Outdoor Unit Alarm History: Display of Outdoor Unit Alarm History

\* Displays outdoor unit alarms only. Does not display indoor unit alarms.

\* Check the indoor unit alarm histories separately using the indoor unit remote controllers or other control device.

### <Operating procedure>

- (1) Press and hold the  (Check) button and  button simultaneously for 4 seconds or longer to engage outdoor unit alarm history mode.

During temperature monitoring,  illuminates.

The display and operations are the same as for the alarm history monitor performed from the indoor unit remote controller. However the "UNIT No." display shows the outdoor unit address.

- (2) Press the  button and select the outdoor unit for which to monitor the alarm history.
- (3) Press the temperature setting  and  buttons and select the item code for the alarm history.

The select outdoor unit address, the item code, and the alarm history (alarm data) are displayed.

The outdoor unit address is displayed as R.C. XX-YY.

System XX = Outdoor unit system address

R.C. XX = Outdoor unit system address

YY = Outdoor unit sub-bus address

Item codes 01-08 are displayed. 01 indicates the most recent alarm.

The alarm history displays the alarm code. (If no alarm are present, then -- -- is displayed.)

- (4) To clear the alarm history, press the  button. (The outdoor unit alarm history will be cleared.)
- (5) To exit, press the  (Check) button. The display returns to the normal display.

## 6-6. Settings Modes: Setting the Outdoor Unit EEPROM

### ● Setting mode 1

<Operating procedure>

- (1) Press and hold the  (Check) button and  (Ventilation) button simultaneously for 4 seconds or longer.
- (2) Press the temperature setting  and  buttons to change the item code. The item codes and setting data are shown in the table below.
- (3) Press the timer time  and  buttons to change the setting data.

To confirm the changed setting data, press the  button.

(At this time, “SETTING” display stops blinking and remains lit.)

- (4) During this mode, “SETTING” is displayed, blinking. The outdoor unit address display section displays “ALL,” the item code and number (DN value in the table), and the setting data (6 digits).

(The setting data is displayed in 6 digits. The display changes between the first 3 digits (Fig. (C)). and the last 3 digits (Fig. (D)).

(When the first 3 digits are displayed, the bottom dot of the colon is illuminated.)

- (5) To exit the setting mode, press the  (Check) button.

(C) Display of first 3 digits

(D) Display of last 3 digits

(C) and (D) are displayed alternately.  
(Example shows display of 000 001.)

**List of Item Codes (Some item codes cannot be set due to the type of models.)**

| Item code | Parameter  |  |
|-----------|--|--|
| 05        | Silent level   | 1=Silent level1 2=Silent level2 3=Silent level3  |
| 07        | Ignore capacity  | 0 = Disabled 1 = Ignores capacity ratio  |

## 7-1. Simple Settings Function

- This allows the filter lifetime, operating mode priority change, central control address, and other settings to be made for an individual or group-control indoor unit to which the remote controller used for simple settings is connected.

When simple settings mode is engaged, operation stops at the individual or group-control indoor unit to which the remote controller for simple settings is connected.

### <Procedure of CZ-RTC2>

- Press and hold the  and  buttons simultaneously for 4 seconds or longer.
- "**SETTING**", unit No. "**1-1**" (or "**ALL**" in the case of group control), item code "**01**," and settings data "**00XX**" are displayed blinking on the remote controller LCD display (Fig. 7-1). At this time, the indoor unit fan (or all indoor unit fans in the case of group control) begins operating.
- If group control is in effect, press the  button and select the address (unit No.) of the indoor unit to set. At this time, the fan at the indoor unit begins operating.  
\* If unit No. "**ALL**" is displayed, the same setting will be made for all indoor units.
- Press the temperature setting  /  buttons to select the item code to change.
- Press the timer time  /  buttons to select the desired setting data.  
\* For item codes and setting data, see page 7-5.
- Press the  button. (The display stops blinking and remains lit, and setting is completed.)
- Press the  button to return to normal remote controller display.

### <Procedure of CZ-RTC4>

- ① Press and hold the  and  buttons simultaneously for 4 seconds or longer.
- ② "SETTING", unit No. "1-1" (or "ALL" in the case of group control), item code "01" and settings data "00XX" are displayed blinking on the remote controller LCD display (Fig. 7-3). At this time, the indoor unit fan (or all indoor unit fans in the case of group control) begins operating.
- ③ If group control is in effect, press the  button and select the address (unit No.) of the indoor unit to set. At this time, the fan at the indoor unit begins operating.  
\*If unit No. "ALL" is displayed, the same setting will be made for all indoor units.
- ④ Press the temperature setting  /  buttons to select the item code to change.
- ⑤ Press the timer time  /  buttons to select the desired setting data.  
\*For item codes and setting data, refer to the following page.
- ⑥ Press the  button. (The display stops blinking and remains lit, and setting is completed.)
- ⑦ Press the  button to return to normal remote controller display.

### NOTE

- In order to avoid water leakage and damage to the fan, do not set for humidifying when the thermostat is OFF unless a vaporizing humidifier is used.
- Consider the device purpose and type when changing the settings. Incorrect settings may result in malfunction.
- Do not change any setting data that does not appear in this list.

### 7-3. Detailed Settings Function

- This allows the system address, indoor unit address, and other settings to be made for the individual or group-control indoor unit to which the remote controller used for detailed settings is connected.

When detailed settings mode is engaged, operation stops at the individual or group-control indoor unit where the remote controller used for detailed settings is connected. Simple settings items can also be set at this time.

#### <Procedure of CZ-RTC2>

- Press and hold the , **SET** and **CAN CEL** buttons simultaneously for 4 seconds or longer.
- "**SETTING**", unit No. "**1-1**" (or "**ALL**" in the case of group control), item code "**10**," and settings data "**00XX**" are displayed blinking on the remote controller LCD display (Fig. 7-4).  
At this time, the indoor unit fan (or all indoor unit fans in the case of group control) begins operating.
- If group control is in effect, press the **UNIT** button and select the address (unit No.) of the indoor unit to set. At this time, the fan at the indoor unit begins operating.
- Press the temperature setting  /  buttons to select the item code to change.
- Press the timer time  /  buttons to select the desired setting data.

\*For item codes and setting data, see page 7-9.

- Press the **SET** button. (The display stops blinking and remains lit, and setting is completed.)
- Press the  button to return to normal remote controller display.

|           |   | 0060         | Continuously ON                                       |
| 60        | Timer function change prohibit  | 0000         | Function disabled                                     |
|           |   | 0001         | Function enabled                                      |
| 62        | Smudging control  | 0000         | No smudging control                                   |

## 7-5. Simple Setting Items

| Item code | Item  | Description   |
|-----------|---|---|
| 01        | Filter sign ON time setting (filter lifetime) | Changes the indoor unit filter lifetime when a high-performance filter or other optional product is installed.  |
| 02        | Degree of filter fouling                      | Reduces the filter sign ON time to 1/2 of the standard time (setting at the time of shipping) for cases when filter fouling is more severe than normal. |

### Filter sign ON times for each model

| Model data | Model  | Filter sign ON time |              |           |              |
|------------|--|---------------------|--------------|-----------|--------------|
|            |  | Standard            |              | Long-life |              |
|            |  | Standard            | High fouling | Standard  | High fouling |
| 0001       | 4-Way Cassette (U2)<br>4-Way Cassette 60 x 60 (Y2) | x                   | x            | 2500      | 1250         |
| 0005       | Low Silhouette<br>Ducted (F1)                      | x                   | x            | x         | x            |
| 0007       | Ceiling (T2)                                       | x                   | x            | 1500      | 750          |
| 0008       | Wall Mounted (K1)                                  | 150                 | 75           | x         | x            |
| 0036       | Ducted (N1)  | x                   | x            | x         | x            |

#### NOTE

- x indicates that there is no corresponding filter.
- **150** indicates the filter sign ON time that is set at shipment.
- High fouling: Set when **0001** is selected for the degree of filter fouling (item code **02**).

| Item code | Item                           | Description  |
|-----------|--------------------------------|--|
| 03        | Central control address        | Set when using a central control device.<br>Used when setting the central control address manually from the remote controller. |
| 04        | Operating mode priority change | Note (1)   |

#### NOTE

There are other methods to avoid control in which the mode selected first takes priority.

Methods of remotely controlling the operating mode

- (1) Use the central functions of a central control device.
- (2) Use a remote control relay PCB at the outdoor unit.

When the operating mode at the priority remote controller is changed, the operating modes of other remote controllers change as shown below.

| Mode change at priority remote controller |          | Operating modes at other remote controllers |                       |
|---|----------|---|-----------------------|
| Current mode                              | New mode | Current mode                                | New mode              |
| Cooling or dry                            | Heating  | Cooling or dry                              | Heating               |
|   |          | Fan   | Fan (not changed)     |
| Heating                                   | Cooling  | Heating                                     | Cooling               |
|   |          | Fan   | Fan (not changed)     |
| Cooling                                   | Dry      | Cooling                                     | Cooling (not changed) |
|   |          | Dry   | Dry (not changed)     |
| Heating                                   | Dry      | Heating                                     | Cooling               |
|   |          | Fan   | Fan (not changed)     |
| Cooling or dry                            | Fan      | Cooling                                     | Cooling (not changed) |
|   |          | Dry   | Dry (not changed)     |
|   |          | Fan   | Fan (not changed)     |
| Heating                                   | Fan      | Heating                                     | Heating (not changed) |
|   |          | Fan   | Fan (not changed)     |

| Item code | Item   | Description  |
|-----------|--|--|
| 05        | Fan speed setting when heating thermostat is OFF | Changes the fan speed setting when the heating thermostat is OFF.  |
| 06        | Heating intake temperature shift                 | Shifts the intake temperature during heating.<br>Can be set when the body thermostat is used.  |
| 07        | Electric heater installation                     | Set when cost distribution is performed using an AMY central control system or similar system, and when an optional electric heater is installed. (This is unrelated to control of the electric heater.)   |
| 08        | Humidifying when heater thermostat is OFF        | Normally humidifying does not occur when the thermostat is OFF during heating operation. However, this setting can be changed in order to increase the amount of humidifying.<br>Caution: In order to avoid water leakage and damage to the fan, do not use this setting unless a vaporizing humidifier is used. |
| 0D        | Permit/prohibit automatic heating/cooling        | This setting can be used to prevent the automatic heating/cooling display on the remote control if the unit configuration permits automatic heating/cooling operation.   |
| 0F        | Cooling-only                                     | This setting allows a heat pump indoor unit to be operated as a cooling-only unit.   |

## 7-6. Detailed Setting Items

| Item code | Item  | Description  |
|-----------|---|--|
| 10        | Unit type   | Set when the indoor unit EEPROM memory is replaced during servicing.   |
| 11        | Indoor unit capacity  |  |
| 12        | System (outdoor unit) address   | These are not set at the time of shipping from the factory. These must be set after installation if automatic address setting is not performed.  |
| 13        | Indoor unit address   |  |
| 14        | Group address   |  |
| 17        | Cooling intake temperature shift                                      | Shifts the intake temperature during cooling and dry operation. (Enabled only when the body thermostat is used.) Increase this value when it is difficult to turn the thermostat ON.   |
| 18        | Automatic stop time after operation start                             | The time at which an indoor unit is automatically stopped after operation starts can be set in increments of 5 minutes   |
| 1b        | Forced thermostat ON time   | Use this setting to change the time for forced operation at installation or servicing from 5 minutes to 4 minutes. (Enabled only with PAC models.)   |
| 1E        | Temperature shift for cooling/heating change in "auto heat/cool" mode | "Auto heat/cool" selects the operating mode automatically based on the difference between the room temperature and the temperature set on the remote controller. This setting establishes a shift temperature for the heating/cooling temperature setting relative to the remote controller temperature setting. |

| Item code                            | Item  | Description   |                |
|--------------------------------------|---|---|----------------|
| 1F (Upper limit)<br>20 (Lower limit) | Change to the remote control temperature setting range            | This setting changes the temperature range (upper limit and lower limit) which is set from the remote controller or central control device. The set upper limit must be greater than or equal to the lower limit. If the temperature setting is to be a single point, set the upper limit and lower limit to the same temperature.  |                |
| 21 (Upper limit)<br>22 (Lower limit) |   |   | Cooling        |
| 23 (Upper limit)<br>24 (Lower limit) |   |   | Heating        |
| 25 (Upper limit)<br>26 (Lower limit) |   |   | Drying         |
|                                      |   |   | Auto heat/cool |
|                                      |   |   |                |
| 29                                   | Humidifier operation which ignores the heat exchanger temperature | During heating operation, the humidifier operates when the heat exchanger temperature is suitable for humidifying. This setting is used to ignore this condition for humidifier operation and operate the humidifier more.  |                |
| 2A                                   | Filter input switching  | This setting switches the filter input according to the purpose of use.   |                |
| 2C                                   | Indoor unit electronic control valve                              | This setting indicates whether or not an indoor unit electronic control valve is present.<br>At the time of shipping, this setting is set according to the conditions of the indoor unit.   |                |
| 2E                                   | T10 terminal input switching                                      | Ordinarily, the T10 terminal is used as the HA terminal at the time of shipping. However, this setting is used when the T10 terminal is used for OFF reminder or for fire prevention input.   |                |
| 31                                   | Ventilation fan operation from remote controller                  | It is possible to install a total heat exchanger and ventilation fan in the system, which can be started and stopped by the wired remote controller. The ventilation fan can operate linked with the start and stop of the indoor unit, or can be operated even when the indoor unit is stopped.<br>Use a ventilation fan that can accept the no-voltage A contact as the external input signal.<br>In the case of group control, the fans are operated together. They cannot be operated individually. |                |
| 32                                   | Switching to remote controller sensor                             | This setting is used to switch from the body sensor to the remote controller sensor.<br>Check that "remote controller sensor" is displayed.<br>Do not use this setting with models that do not include a remote controller sensor.<br>Do not use this setting if both the body sensor and remote sensor are used.   |                |
| 34                                   | ON/OFF of "Operation change control in progress" display          | In a MULTI system with multiple remote controllers, switching between heating and cooling is restricted, and "Operation change control in progress" is displayed.<br>This setting is used to prevent this display from appearing.<br>Refer to the item concerned with operating mode priorities.  |                |
| 35                                   | OFF reminder function for weekly timer                            | This setting switches the operation when the weekly timer is connected to the remote controller.<br>This can be used to prevent cases in which the unit is accidentally left ON. There is no change when this setting is ON, however it is necessary to set the weekly timer ON time.   |                |

(Continued from previous page)

| <b>Item code</b> | <b>Item</b>   | <b>Description</b>  |
|------------------|---|---|
| <b>3C</b>        | Heat exchanger temperature for cold air discharge     | The heat exchanger temperature control point for prevention of cold air discharge during heating operation can be changed.  |
| <b>3d</b>        | Fan output switching                                  | The indoor unit PCB optional output for the fan can be switched according to the purpose of use.  |
| <b>3E</b>        | Drain pump delayed stop time                          | The drain pump stops after the set time delay after cooling operation stops.  |
| <b>40</b>        | Humidifier drain pump setting                         | This specifies the humidifier and drain pump setting.   |
| <b>45</b>        | DC flap operation mode                                | Changes flap operation to draft reduction mode.   |
| <b>46</b>        | DC flap swing mode                                    | Selects the swing operation mode for the flap.  |
| <b>5d</b>        | DC fan tap setting                                    | Sets the DC fan tap according to the purpose of use.<br>Change the settings data at the same time.  |
| <b>5E</b>        | Humidifier ON time                                    | Sets the humidifier output ON time for when the humidifier is operating.<br>ON/OFF control is performed during humidifier operation.<br>This setting therefore sets the ON time per 60-second interval. |
| <b>5F</b>        | Stop at time set for OFF timer after operation starts | This setting enables a function that stops operation when the amount of time set for the OFF timer has passed after remote controller operation was started.  |
| <b>60</b>        | Timer function change prohibit                        | This function prohibits changes from being made to the remote controller time setting.  |
| <b>62</b>        | Smudging control                                      | Smudging control is disabled when 0000 is set.  |

## ■ DC Fan Tap Change Procedure (Example of Type U2)

### <Procedure>

It is necessary to set the fan speed in accordance with the intended application and the optional parts to be used if any such part is used. (Table 1)

If this speed is not changed, a reduction in the air flow may result, causing the air outlet temperature to drop and condensation to form during cooling.

There are two ways to set the fan speed: either (1) change the positions of the DIP switches on the indoor unit control PCB or (2) set the speed using the wired remote controller. Select one of these ways.

\* Priority is given to setting the fan speed by changing the positions of the DIP switches.

(Table. 1) DC fan motor tap setting table

| Setting No | Item code 5D/5d setting data | Intended application / name of optional parts         | Setting No | Item code 5D/5d setting data | Intended application / name of optional parts         |
|------------|------------------------------|---|------------|------------------------------|---|
|            | 0000                         | Standard (factory setting)                            | (1)        | 0001                         | Air-flow blocking kit (for 3-way air flow)            |
| (1)        | 0001                         | High-ceiling setting 1 (with standard, ECONAVI panel) | (3)        | 0003                         | High-ceiling setting 2 (with standard, ECONAVI panel) |
|            |                              | Air-flow blocking kit (when a duct is connected.)     | (6)        | 0006                         | Air-flow blocking kit (for 2-way air flow)            |

### (1) When setting the fan speed by changing the positions of the DIP switches on the indoor unit control PCB

<Procedure> Be absolutely sure to turn off the power (earth-leakage circuit breaker).

- <1> On Table 1, check out the "Setting No." that corresponds to the intended application and the optional parts to be used.
- <2> Open the cover of the electrical parts box, and check the indoor unit control PCB. (Fig. 7-7)
- <3> Select the Setting No. which was checked out on Table 1, and change the positions of the DIP switches on the indoor unit control PCB.

| Setting No. | DIP switch   |
|-------------|--|
| (1)         | <p>DIP switch "ON" position<br/>"OFF" position</p> |
| (3)         | <p>DIP switch "ON" position<br/>"OFF" position</p> |
| (6)         | <p>DIP switch "ON" position<br/>"OFF" position</p> |

(Fig. 7-7) Indoor unit control PCB

### (2) When setting the fan speed using a wired remote controller (optional parts: CZ-RTC5A)

On Table 1, check out the "Item code 5D setting data" that corresponds to the intended application and the optional parts to be used.

<Procedure> Ensure that the unit has stopped operating before changing the fan speed.

- <1> Hold down the + + buttons together for at least 4 seconds. The maintenance function screen is displayed.
- <2> Use the / buttons to select the display and the / buttons to select the page. Select "8. Detailed settings" and press the button. The [Detailed settings screen] appears. Using the / buttons, select the unit No.
- <3> Using the / buttons, select the item code. Using the / buttons, change the item code to "5D."
- <4> Using the / buttons, select the setting data. Using the / buttons, change the setting data to the value checked out on Table 1, and press the button.
- <5> After selecting the unit No. using the / buttons, press the button. The [Detailed settings completion screen] appears. Select "Yes", and press the button.

Unit No. | Setting data  
Item code

### (3) When setting the fan speed using a wired remote controller (optional parts: CZ-RTC4)

On Table 1, check out the "Item code 5d setting data" that corresponds to the intended application and the optional parts to be used.

<Procedure> Ensure that the units have stopped operating before changing the fan speed.

- <1> Hold down the + + buttons together for at least 4 seconds.
- <2> Each time the button is pressed, the numbers of the indoor units under group control are displayed in sequence. The fan motor of only the indoor unit that has been selected will run.
- <3> Specify item code "5d" using the temperature setting ( / ) buttons.
- <4> Change the setting data using the hour buttons. The setting data details are as given on Table 1.
- <5> Press the button. (OK if the display changes from flashing to lighted.)
- <6> Press the button. The normal stop status is established. Go to step <2> to change the selected indoor unit.
- <7> Press the button. The normal stop status is established.

## 7-7. Remote Controller Servicing Functions

- The remote controller includes a number of servicing functions. Use these as needed for test runs and inspections.

### ■ Timer Remote Controller CZ-RTC2

CZ-RTC2

Fig. 7-8

### List of Servicing Functions

| Functions                  | Description   | Button operation  | Reset operation   | Unit status   |
|----------------------------|---|---|---|---|
| Test run                   | Operation with forced thermostat ON   | Press and hold the  button for 4 seconds or longer.  | Press the  button. | Current operation is maintained.  |
| Sensor temperature display | Temperature display from each sensor  | Press and hold the  and  buttons for 4 seconds or longer.   |   |   |
| Servicing check display    | Alarm history display   | Press and hold the  and  buttons for 4 seconds or longer.   |   |   |
| Simple settings            | Filter lifetime, operating mode priority, central control address, and other settings | Press and hold the  and  buttons for 4 seconds or longer.   | Automatic reset   | When settings are made from a remote controller, the indoor unit where that remote controller is connected stops. |
| Detailed settings          | System address, indoor unit address, central control address, and other settings      | Press and hold the  ,  and  buttons for 4 seconds or longer. |   |   |
| Automatic address          | Automatic address setting based on command from the wired remote controller           | Press and hold the  and the timer operation  buttons for 4 seconds or longer.   | Press the  button. | Entire system stops.  |
| Address change             | Change of indoor unit address   | Press and hold the  and the timer operation  buttons for 4 seconds or longer.   |   |   |

## ■ High-spec Wired Remote Controller CZ-RTC3 / CZ-RTC5A

Display of "maintenance function" screen

- ① Keep pressing the ,  and  buttons simultaneously for 4 or more seconds. The "Maintenance func" screen appears on the LCD display.
- ② Press the  or  button to see each menu. If you wish to see the next screen instantly, press the  or  button.

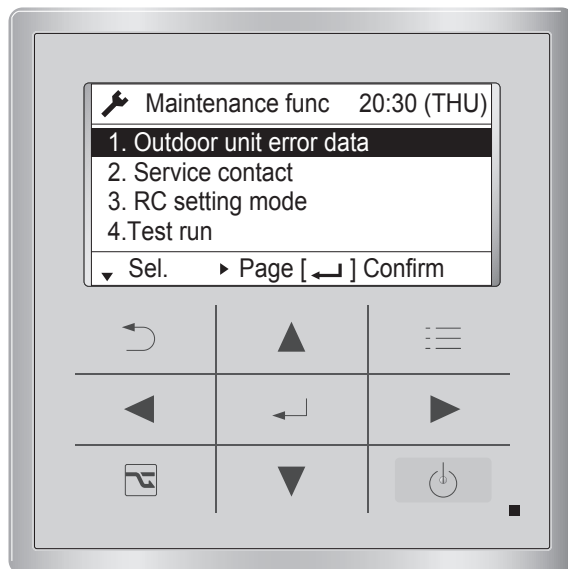

Fig. 7-9

| Address change             | Change of indoor unit address   | Press and hold the  and the timer operation  buttons for 4 seconds or longer. |                    |   |

## 7-8. Test Run Function

Operates the unit with the thermostat forced ON.

### <Procedure of CZ-RTC2>

- ① Press and hold the  button for 4 seconds or longer.
- ② "TEST" appears on the remote controller LCD display (Fig. 7-11).
- ③ Press the  button to start the test run.
- ④ Press the  button to return to normal remote controller display.

Fig. 7-11 CZ-RTC2

### <Procedure of CZ-RTC3 / CZ-RTC5A>

- ① Keep pressing the , , and  buttons simultaneously for 4 or more seconds. The "Maintenance func" screen appears on the LCD display.

- ② Press the  or  button to see each menu. If you wish to see the next screen instantly, press the  or  button. Select "4. Test run" on the LCD display and press the  button.

Change the display from OFF to ON by pressing the  or  button. Then press the  button.

### <Procedure of CZ-RTC4>

- ① Press and hold the  button for 4 seconds or longer.
- ② "TEST" appears on the remote controller LCD display (Fig. 7-13).
- ③ Press the  button to start the test run.
- ④ Press the  button to return to normal remote controller display.

Fig. 7-13 CZ-RTC4

CZ-RTC3 / CZ-RTC5A  
Fig. 7-12

- ③ Press the  button. "TEST" will be displayed on the LCD display.

- ④ Press the  button. Test run will be started. Test run setting mode screen appears on the LCD display.

## ■ Sensor Temperature Display Function (displayed regardless of whether unit is operating or stopped)

The procedure below displays the sensor temperatures from the remote controller, indoor unit, and outdoor unit on the remote controller.

### <Procedure of CZ-RTC2>

- ① Press and hold the  and  buttons simultaneously for 4 seconds or longer.
- ② The unit No. "X-X" (main unit No.), item code "XX" (sensor address), and servicing monitor "00XX" (sensor temperature) are displayed on the remote controller LCD display. (See Fig. 7-14 at right.)
- ③ Press the temperature setting   buttons and select the item code to the address of the sensor to monitor.  
(For the relationships between the sensor addresses and sensor types, refer to the table of temperature sensors and addresses at below.)
- ④ If group control is in effect, press the  button to select the unit to monitor.  
Press the temperature setting buttons to select the item code to change.
- ⑤ Press the  button to return to normal remote controller display.

Fig. 7-14

### Note:

The temperature display appears as "- - -" for units that are not connected.

- \* If monitor mode is engaged while normal operation is in progress, only the parts of the LCD display shown in the figure will change. Other parts continue to display the same information as during normal operation.

|                  | Item code         | Meaning of Code                        |
|------------------|-------------------|--|
| Indoor unit data | 02                | Indoor unit intake temp.               |
|                  | 03                | Indoor unit heat exchanger temp. (E1)  |

CZ-RTC3 / CZ-RTC5A

Fig. 7-15

<Procedure of CZ-RTC4>

- ① Press and hold the  and  buttons simultaneously for 4 seconds or longer.
- ② The unit No. "X-X" (main unit No.), item code "XX" (sensor address), and servicing monitor "00 YY" (sensor temperature) are displayed on the remote controller LCD display. (See Fig. 7-16 at right.)
- ③ Press the temperature setting  /  buttons and select the item code to the address of the sensor to monitor.
- ④ If group control is in effect, press the  button to select the unit to monitor.  
Press the temperature setting buttons to select the item code to change.
- ⑤ Press the  button to return to normal remote controller display.

Fig. 7-16

## Automatic address setting

### <Procedure of CZ-RTC3 / CZ-RTC5A>

- Keep pressing the ,  and  buttons simultaneously for 4 or more seconds. The "Maintenance func" screen appears on the LCD display.
- Press the  or  button to see each menu. If you wish to see the next screen instantly, press the  or  button. Select "9. Auto address" on the LCD display and press the  button.

|   |             |
|---|-------------|
|  Maintenance func          | 20:30 (THU) |
| <b>9. Auto address</b>  |             |
| 10. Set elec. consumption   |             |
| 11. Set touch key   |             |
| 12. Check touch key   |             |
| ↕ Sel. ◀ Page [  ] Confirm |             |

- The "Auto address" screen appears on the LCD display. Change the "Code no." to "A1" by pressing the  or  button.

|               |              |
|---------------|--------------|
| Auto address  | 20:30 (THU)  |
| Code no.      | O/D unit no. |
| <b>A1</b>     | 1            |
| ↕ Sel. ▶ Next |              |

- Select the "O/D unit no." by pressing the  or  button. Select one of the "O/D unit no." for automatic address by pressing the  or  button. Then press the  button. Approximately about 10 minutes are required. When automatic address setting is completed, the units return to normal stopped status.

CZ-RTC3 / CZ-RTC5A

## ■ Important Safety Instructions

### WARNING

#### Installation Precautions

- Do not install yourself  
Installation should always be performed by your dealer or a professional service provider.  
Electric shock or fire may result if an inexperienced person performs any installation or wiring procedures incorrectly.
- Use only specified air conditioners  
Always use only air conditions specified by the dealer.

#### Precautions for Use

- Do not touch switches with wet hands  
Electric shock and damage to the system can result.
- Protect the remote controller from water  
Damage to the system can result.
- Stop the system and turn the power off if you sense unusual smells or other irregularities  
Continuing operation when the system is out of order can result in electric shock, fire, and damage to the system.  
Contact your dealer.
- Do not swallow the battery.

#### Moving and Repair Precautions

- Do not repair  
Never repair the system by yourself.
- Contact your dealer before moving the system  
Contact your dealer or a professional service provider about moving and reinstalling the system.  
Electric shock or fire may result if an inexperienced person performs any installation procedures incorrectly.

## ■ Optional Controller (Remote Controller)

Wireless Remote Controller CZ-RWSU3 / CZ-RWSC3 / CZ-RWSK2 / CZ-RWST3N

One remote controller can control a group of up to eight indoor units.

### 8-1. Names and Functions

#### REMOTE CONTROLLER

|  |  |   |   |
|--|--|---|---|
| <b>1. Operation Display</b>  | Displays the operation status.<br>(The figure shows all the statuses.) <ul style="list-style-type: none"> <li>The auto-flap display may be different, depending on the installed unit.</li> </ul>  | <b>15. Sensor button</b>  | Use this button to activate the temperature sensor on the remote controller instead of the one on the indoor unit. The temperature sensor on the indoor unit is selected before shipment. At this time  is shown on the display. |
| <b>2. Start/Stop button</b>   | Pressing this button once starts and pressing again stops the operation.   | <b>16. Clock button</b>  | Use this button to set the clock.   |
| <b>3. Fan speed button</b>    |  |                          |   |
| <b>4. Swing/Wind Direction button</b>   |  |   |   |
| <b>5. Timer setting button</b>   | Use for operating with a timer.  |   |   |
| <b>6. Reset button</b>   | Use this button after changing the batteries.  |   |   |
| <b>7. Cover</b>  | Press at the top center and then slide down.   |   |   |
| <b>8. Transmitter</b>  |  |   |   |
| <b>9. Remote controller sensor</b>   | Detects the temperature at the remote controller when detection has been switched to the remote controller by the sensor button.   |   |   |
| <b>10. Temperature setting buttons</b>   |  raises the temperature setting 1 °C at a time.<br> lowers the temperature setting 1 °C at a time.   |   |   |
| <b>11. Filter button</b>    | <b>CZ-RWSC3</b><br>Press to turn off the filter lamp on the receiver.  |   |   |
| <b>12. Mode Select button</b>   | Press to switch the operation mode.  |   |   |
| <b>13. Ventilation button</b>   | Use this button when connected to an aftermarket fan. Pressing this button starts and stops the fan. When the air conditioner is started or stopped, the fan starts or stops at the same time. (  appears on the display of the remote controller when the fan is operating.) |   |   |
| <b>14. Address button</b>   |  |   |   |

From this page on the names of remote controller's buttons will be indicated with the above illustrations.  
 E.g.: Start/Stop button → 

## RECEIVER

|                                      |  |
|--------------------------------------|--|
| <b>1. Receiver</b>                   | Receives the signal sent from the remote controller.   |
| <b>2. Emergency operation button</b> | <b>Display lamps</b><br>When an error occurs, one of the lamps flashes. When a display lamp is blinking, refer to " Before Requesting Service ".   |
| <b>3. Operating lamp</b>             | This lamp is lit when the unit is operating.   |
| <b>4. Timer lamp</b>                 | This lamp is lit when the timer is set.  |
| <b>5. Standby lamp</b>               | <ul style="list-style-type: none"> <li>When the heater is working, the lamp lights at the following times.<br/>When the thermostat has operated during defrosting at the time of the startup.</li> <li>The lamp flashes when an error occurs.</li> </ul> |
| <b>6. Filter lamp</b>                | This lamp is for notifying you when the filter needs to be cleaned.  |

### CZ-RWSU3

### CZ-RWST3N

### CZ-RWSC3

### Indoor Unit (CZ-RWSK2)

## NOTE

- If a heat pump model is being used, it will beep twice and the operating lamp will light up on the display; if the timer and standby lamps blink alternately, a conflict between the heating and cooling exists, so the unit cannot operate in the desired mode. (On models that do not have an Auto function, even if Auto is selected, it works in the same way.)
- When the local operation is disabled by such as the centralized control, and if the Start, Stop, Mode or Temperature setting buttons are pressed, the unit will beep five times and the change will not be made.

## 8-2. Installing Batteries

1. Remove the cover.

2. Insert two LR03 size batteries.

Put the batteries in with the polarity [+/-] as shown in the figure.

3. Gently insert one end of an unfolded paper clip (or a similar object that can fit) into the Reset hole and press the Reset button inside the hole, then put the cover back on.

### NOTE

- Change the batteries when the display of the remote controller gets weak or if it will not work unless close to the receiver.  
(Alkaline batteries generally last about one year.)
- When changing batteries, always use two fresh batteries of the same make.
- If the remote controller will not be used for a long period of time, remove the batteries.
- Please dispose of batteries appropriately.
- After changing the batteries, follow the procedures on the next page to reset the current time.

## How to remove batteries

1. Remove the cover.

2. Press the battery toward the negative end and lift it out by its positive end.  
(As shown at right)

3. Remove the other battery in the same way.

### NOTE

- Dispose of the used batteries at the designated location in compliance with the applicable local ordinances.

### WARNING

- Do not swallow the battery.
- After removing the battery from remote controller, keep it away from the reach of children.  
The battery can cause death by suffocation if swallowed.
- When inserting the battery, make sure the polarities (+ and -) are correct.

## 8-3. Setting the Current Time

After changing the batteries and pressing reset, be sure to reset the current time.

(When reset is pressed, the current time reverts to [0:00])

1. Press  $\ominus$  for two seconds or more.

Once the clock displays starts blinking, the clock can be set.

2. Set the hour with  $\blacktriangle$  /  $\blacktriangledown$  of the  $\odot 1$ .

If you press and hold the button, the time changes quickly.

3. Set the minutes with  $\blacktriangle$  /  $\blacktriangledown$  of the  $\odot 0$ .

If you press and hold the button, the time changes quickly.

4. Pressing  $\ominus$  completes the time setting.

- While you are setting the current time, the time display flashes but the colon does not.
- If the buttons are not pressed for three minutes while setting the current time, it is set to the displayed time.

### NOTE

When reset is pressed, the timer settings are deleted.

## 8-4. Operation

**Auto** , **Heat** , **Dry** , **Cool** , **Fan** 

Models that only provide the cooling function cannot operate in the auto or heating modes.

**Power:** Turn on the power of the indoor unit at least 14 hours before operation.

1. Press .
2. Press  and select from among Auto , Heat , Dry , Cool  and Fan .
3. Press  and select the desired speed.  
If set to Auto  , the fan speed switches automatically.  
(Auto does not work when in the Fan mode.)
4. Press one of the   buttons and set the desired temperature.

Temperature settings cannot be made when in the Fan mode.

|     | Auto  | Heat  | Dry  / Cool  |
|-----|--|--|--|
| MAX | 27   | 30   | 30   |
| MIN | 17   | 16   | 18   |

**Stop:** Press .

When the unit is stopped with the remote controller, the fan on the outdoor unit may continue to run for a while, even though the compressor of the outdoor unit stops.

**If the unit is not heating very effectively with a Low fan speed , switch the fan speed to High  or  Medium.**

Depending on the indoor unit being used, it may indicate a function that it does not have. (The fan speed is set.)

**If you cannot turn the air conditioner off in the normal way.**

Disconnect the power to the indoor unit and contact the dealer where the product was purchased.

### <Auto Operation>

Only when identical refrigerant system inside all the indoor units or cooling/heating free-type are under control as one group. It heats or cools automatically via the differences between the set temperature and the room temperature.

### <Dry Operation>

- Depending on the indoor unit used, the remote controller may have a [Dry]  indicator on its display even though the unit does not have the Dry function. (Same as cooler operation)
- When the room temperature approaches the temperature setting, the unit continues to start up or stop automatically.
- When the drying mode stops operating, the indoor unit's fan blows a gentle breeze in order to keep the moisture from returning to the room at a minimum.
- Depending on the indoor unit used, and/or the temperature in the room, the fan speed may not be adjustable.
- Depending on the unit used, when the outside air temperature is 15 °C or less, the dry function will not operate.

## 8-5. Timer Operation

- When setting the timer, make sure the current time on the remote controller is accurate.
- The timer's clock can only be set when the display of the remote controller is ON.
- After setting the timer, put the remote controller in a place where its signal will reach the receiver of the indoor unit. (When the time set for the timer is reached, a signal is sent from the remote controller to Start/Stop the unit.)

### Using the Timer

1. Press either ▲ / ▼ of the  or , and while the time is being displayed, if you press ▲ / ▼ again, a scheduled time can be set.

The time last set on the timer is displayed.

“--:--” indicates time to change the batteries.

2. Press either ▲ / ▼ of the  or  and set the timer to the desired time.

Every time you press ▲ / ▼, the time changes in 10 minute increments.

If you press and hold the button, the time changes quickly.

3. After setting the timer, if you press , the time you set changes to a steady display, indicating settings are complete.

After the timer setting is displayed for three seconds, the display reverts to the current time.

### Combining ON and OFF Timers

- Setting the ON and OFF timers, respectively.

### Checking the timer setting

- If you press either ▲ / ▼ for the  or the , the scheduled time is displayed for four seconds.
- When no timer setting has been made, it displays --:--. (Initial Setting)

### Changing a timer setting

- Press ▲ / ▼ for the  or the , and then when the timer setting is displayed, press ▲ / ▼ for the timer again.

### Canceling a timer setting

- If you press [CANCEL], the timer setting is canceled.
- If you wish to cancel the setting for either the  or the  timer, press ▲ / ▼, and long-press [CANCEL] while scheduled time is displayed.

### Using the same timer setting every day

- If you press  for 2 or more seconds, “” is displayed and the **ON timer** or the **OFF timer** will operate the unit at the same time every day.
- If you press  again for two seconds or more, “” goes off and the timer operates only one time.

## 8-6. Adjusting the Wind Direction

- Never try to manually move the flap (up-down wind direction plate) that is operated by the remote controller.
- When the unit stops, the flap (up-down wind direction plate) automatically faces downwards.
- When the unit is in heating standby, the flap (up-down wind direction plate) faces upward.

Also, bear in mind that the flap starts swinging after the heating standby mode is released, but the display on the remote controller indicates Auto Flap during standby heating as well.

### CZ-RWSU3 / Indoor Unit (CZ-RWSK2) / CZ-RWST3N

#### Setting the Wind Direction

While the unit is operating, every time you press , the direction the flap faces changes.

#### Setting Flap to Swing

If you press  to set the flap (up-down wind direction plate) in its most downward facing position, and then press  again, **SWING** is displayed and the flap swings automatically up and down.

#### Stopping Flap Swing

If you press  again while the flap is swinging, you can stop the flap from swinging and set it in place as desired. Thereafter, if you press , you can set the wind direction starting from the most upward position.

- When the unit is in the Cool or Dry modes, the flap cannot stop facing downwards. If you try to stop the flap from swinging while it is facing downwards, it will continue moving until it is in the third position from the top.

### CZ-RWSC2

The available functions differ depending on the indoor unit being used.

The wind direction cannot be set via remote controller for any models other than those noted below.

For more information, please refer to the users' manual that came with your indoor unit.

**Four-direction Ceiling Cassette Models, Bi-directional Ceiling Cassette Models, Unidirectional Cassette Models for High Ceilings, Ceiling Suspended Models, Wall-Mounted Models**

Please refer to *Setting the Wind Direction and Stopping Flap Swing*.

## 8-7. Operating Multiple In/Outdoor Units Simultaneously (Group Control)

**Group control works well for providing air conditioning to one, large room with more than one air conditioning units.**

- One remote controller can operate up to eight indoor units.
- All the indoor units have identical settings.
- Set temperature sensing to the indoor unit (Main Sensor). (See page 8-3.)

## 8-8. Using the Remote Controller

- Point the transmitter of the remote controller at the receiver. When the signal is received correctly it will beep once. (It beeps twice only when the unit starts operating.)
- The signal can be received at a distance of about 6 meters. This distance should be used only as a guide. It depends on battery strength.
- Make sure nothing is between the remote controller and the receiver that could block the signal.
- Do not leave the remote controller in direct sunlight, where the wind from the air conditioner can blow directly on it, or near any other heat source.
- Take care not to drop, throw or wash the remote controller with water.
- The signal from the remote controller may not be received in rooms with rapid start fluorescent lighting, inverter lights, plasma displays, LCD televisions (monitor), etc. For more information, please contact the dealer where the product was purchased.

### Wall Mount Use

- Press  from the location you wish to mount the remote controller and make sure the signal is received properly.
- Pull the remote controller forward to remove it.

Fasten the remote controller holder with screws.

Fitting the remote controller in the holder.

## 8-9. For Best Results

### Don't get the remote controller too far away from the receiver.

This may cause a malfunction. Be sure to keep the remote controller in the same room as the receiver.

### Point the remote controller at the receiver.

When the signal is received properly, it will beep one time.

### Avoid locating the remote controller where it is covered, such as behind a curtain.

Keep it out in the open.

## 8-10. Addresses

**In both multi and single unit installations**, when more than one indoor units are installed in the same room with a compatible wireless remote controller, addresses can be set up to avoid crosstalk. By setting the address switches on the receivers and matching them with the number of addresses on the remote controller, up to six indoor units can be controlled separately with the remote controller. (When using units in a flexible combination or operating multiple units simultaneously, they cannot be controlled individually as they are operated at the same time.) There are separate address settings, receiver addresses for the receivers and transmitter addresses for the remote controller.

For more information, please contact the distributor where the product was purchased.

- The setting procedure is different for Indoor Unit (CZ-RWSK2). (See Setting Addresses in the next page.)
- These settings are saved in nonvolatile memory in the remote controller, so even when its batteries are changed, the settings do not have to be made again.

\* 1 CZ-RWST3N is of receivers (Inside the indoor unit)

### Checking Addresses

When you press  on the remote controller, its current address appears on the display. If this address corresponds to the address of a receiver, the buzzer sounds. (If it is on ALL, the buzzer will always sound.)

If it is on ALL, it can be operated regardless of receiver addresses. Point the remote controller at the receiver you wish to operate and transmit.

## Matching up Addresses

### Setting Remote Controller Addresses

1. If you press **[ADR]** and **↶/↷** at the same time, "SET" will blink.
2. While holding **[ADR]** down, every time you press **↶/↷**, it cycles from ALL → 1 → 2 → 3... 6 → ALL.  
Set it to the receiver address switch of the indoor unit you wish to operate.
3. When you release **[ADR]**, the address that was displayed is set.  
When you do this, if it corresponds to the receiver's address setting, the buzzer sounds.

|  |  |  |  |  |  |  |  |
|--|--|--|--|--|--|--|--|
| Address Display on the Remote Controller                   |  |  |  |  |  |  |  |

| Position of receiver's (inside indoor unit) address switch | The position of the receiver's address switch does not matter. |  |  |  |  |  | For 1, 2 and 3, set the switch on the right and for 4, 5 and 6, to the left.<br> |
| <b>CZ-RWST3N</b>   |  |  |  |  |  |  |  |
| Position of receiver's (inside indoor unit) address switch | The position of the receiver's address switch does not matter. |  |  |  |  |  | For 1, 2 and 3, set the switch on the left and for 4, 5 and 6, to the right.<br> |
| <b>CZ-RWSC3</b>  |  |  |  |  |  |  |  |
| Position of the Receiver's Address Switch                  | The position of the receiver's address switch does not matter. |  |  |  |  |  | For 1, 2 and 3, set the switch on the left and for 4, 5 and 6, to the right.<br> |

### Setting Addresses (CZ-RWSK2)

#### (Setting the address of the indoor unit)

1. First of all, set the address for the remote controller with Setting Remote Controller Address (See the previous page).
2. Press **[Emergency Operation]** **⏻** of the indoor unit for four seconds or more.  
When you do this, the lamps of the display will blink one after another.
3. Press **[ADR]** on the remote controller.
4. The buzzer will sound and the address of the indoor unit will change to the address displayed on the remote controller.
5. If you press **[Emergency Operation]** **⏻** of the indoor unit once, the lamps on the indoor unit's display will turn off.

#### NOTE

- Please do not hold the **[Emergency Operation]** **⏻** button of the indoor unit down while the indoor unit's display lamps are blinking one after another.
- Make sure to operate while the indoor unit is stopped.
- The address of indoor unit is set to "ALL" at the time of the shipment.

## 8-11. Emergency Operation

Use [Emergency Operation]  in the following situations when there is an urgent need.

- When the remote controller's batteries have failed.
- When the remote controller is broken.
- When the remote controller is lost.

\*1 Figures: CZ-RWSU3 and CZ-RWST3N are of receivers (inside indoor unit), and Indoor Unit (CZ-RWSK2) is of its front panel.

### CZ-RWSU3 / Indoor Unit (CZ-RWSK2) / CZ-RWST3N

**Start :** press [Emergency Operation]  of the receiver.

If the indoor temperature is 24 °C or greater when the unit starts running, it will act as a cooling mode.

If the indoor temperature is less than 24 °C when the unit starts running, it will act as a heating mode.

**Stop :** press [Emergency Operation]  of the receiver again.

### NOTE

- The Test Run/On and Test/On switches are for use when the unit is installed and test run. It is not for normal use.
- If the [Normal/Stop ALL] switch is on **Stop ALL**, the unit cannot receive signals from the remote controller .

### CZ-RWSC3

**1. Press [Emergency Operation]  of the receiver.**

If the indoor temperature is 24 °C or greater when the unit starts running, it will act as a cooling mode.

If the indoor temperature is less than 24 °C when the unit starts running, it will act as a heating mode.

**2. If you press , the wind direction automatically oscillates up and down.**

**Stop :** press [Emergency Operation]  of the receiver again.

## 8-12. Miscellaneous Settings

A variety of changes can be made to settings, depending on the indoor unit being used.

### Operation mode indicator, time display (24 hour, AM/PM), Heat Max Temp

- (These settings are saved in nonvolatile memory in the remote controller, so even when its batteries are changed, the settings do not have to be made again.)
- First check the display of the remote controller when the unit is stopped and then make any desired settings.

### How to Operate

- While holding down the buttons below, every time  is pressed the remote controller's display changes.
- Whatever is being displayed when you release  is set.

| Setting Item   | Operation Button   | Setting Content                                    | Remote Controller Display  |
|--|--|--|--|
| Remote controller operation mode display setting when  is pressed | Press  while pressing    | Heat Pump (with Auto)                              |   |
|  |  | Heat Pump (without Auto)                           |   |
|  |  | Dedicated air conditioner                          |   |
| Clock display setting  | Press  while pressing    | 24-hour  |   |
|  |  | AM/PM  |   |
| Max possible temperature setting in the Heat mode  | Press  while pressing  | Maximum heating temperature range is 26 °C – 30 °C |  |

## 8-13. Before Requesting Service

Before requesting service, please check the followings.

| Problem  | Cause  | Solution   |
|--|--|--|
| The unit doesn't work even when  is pressed on the remote controller. | The power to the indoor unit is not ON.  | Make sure the power to the indoor unit is ON.  |
|  | Are the remote controller's batteries dead?  | Change the batteries.  |
|  | Is there a mismatch between the display lamp and cooling/heating or is it set to something other than Auto? (The operating lamp stays lit, while the timer lamp and the standby lamp blink alternately.) | Change the operating mode.   |
|  | Do the addresses match one another?  | Check the addresses of the receiver and the remote controller.                       |
| The air conditioner starts and stops on its own.   | Has the timer been set to repeat?  | Check the timer settings.  |
| "EP" is displayed on the remote controller when the unit is stopped.   | An error has occurred in the non-volatile memory.  | Please contact your sales outlet.  |
| Although the unit is for air conditioning only, either Auto or Heat is indicated in the display.   |  | Make settings to the remote controller's operation mode display.                     |
| After putting the batteries in the remote controller, even when it is operated, the display does not change.   |  | Press the Reset button on the remote controller.                                     |
| The timer cannot be set.   |  | Make the settings when the remote controller is in Operation Display. (See page 8-7) |

If the problem persists even after you check the foregoing items, stop the unit, disconnect the power to the indoor unit and contact the dealer where the product was purchased with the model number and problem you are having.

As it is dangerous, under no circumstances should you undertake repairs yourself.

Further, when the receiver's lamps are blinking; please contact your retailer with that information.

| Power source | 16 V DC (Supplied from the terminal strip of the indoor unit's remote controller) |   |

## ■ How to Install the Wireless Remote Controller Receiver

### 8-14. Common to All Models

#### 1. Warnings about Installation of Receivers

The wireless remote controller uses a very weak infrared light for its signal, which can result in the signal not being received because of the following influences, so take care in where the unit is installed.

- Inverter or rapid-start type fluorescent lights. (Models without glow lamps)
- Plasma display or LCD televisions.
- Direct sunlight or other sources of bright light.

#### 2. Warnings about Installing Remote Controllers

- (1) If a remote controller is to be operated from a remote controller holder that is hung on a wall, turn on the lights in the room as well as any electrical appliances and then check to make sure the air conditioner works with the remote controller in the location where it will be installed. If it works, continue with installation.
- (2) If the air conditioner is to be switched from the main sensor to a remote controller sensor, pay attention to the following when installing.
  - Locate where no warm or cold drafts will affect it.
  - Locate in a place free from direct sunlight.
  - Locate where it will not be affected by any other heat/cold source.

#### 3. Things to remember when wired and wireless remote controllers are installed at the same time

Two remote controllers can be used to controller the unit if the wireless remote controller kit is installed at the same time as the wired remote controller.

(Up to 2 remote controllers [a wireless remote controller kit and the wired remote controller] can be installed.)

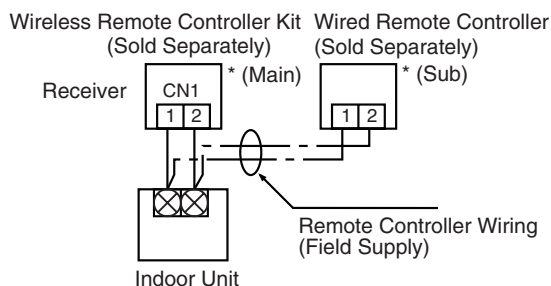

When using 2 remote controllers, one or more units can be operated by the remote controllers.

#### NOTE

1. When wiring remote controllers, be sure to double-check the terminal numbers of the indoor unit before connecting them so there are no mistakes in the wiring. (Damage will occur if high voltage [e.g. supply voltage] is applied)
  2. It is not possible to use more than one wireless remote controller kit with one indoor unit.  
(A receiver located separately can be used at the same time)
  3. If both a wireless and a wired remote controller are to be installed and used at the same time, one of them must be set up as the sub remote controller.
- If the wired remote controller is to be the sub remote controller, change the wired remote controller to the sub remote controller.
  - If the wireless remote controller is to be the secondary, turn the #3 switch on the wireless receiver (operation panel) from OFF to ON. (see next page)

#### When 1 indoor unit is operated by 2 remote controllers:

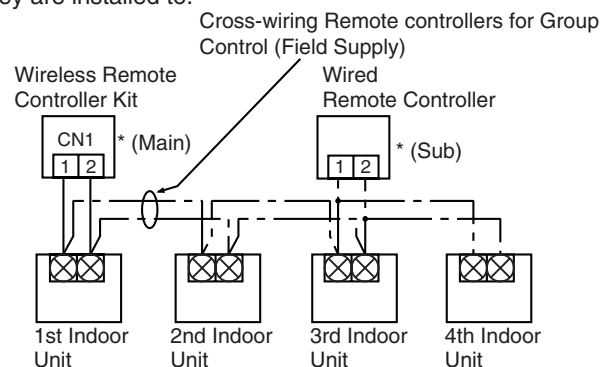

\* Either of the remote controllers can be set to main/sub.

- Use wiring of 0.5 mm<sup>2</sup> to 2 mm<sup>2</sup> for field supply.
- Use a total wire length of no more than 400 m.

#### If a group of units are to be controlled by 2 remote controllers:

\* Main/sub remote controllers will work regardless of which indoor unit they are installed to.

- Use wiring of 0.5 mm<sup>2</sup> to 2 mm<sup>2</sup> for field supply.
- Make the total wire length when cross-wiring a group no more than 200 m.

### CZ-RWSU3

### CZ-RWST3N

### CZ-RWSC3

## 8-15. CZ-RWSU3

### 1. Accessories

| Supplied accessories  |   |   |   |   |  |   |   |
|---|---|---|---|---|--|---|---|
| Receiver<br>(1)   | Wireless Remote Controller<br>(1)   | Remote Controller Holder<br>(1)   | LR03 Size Battery<br>(2)  | Operating Instructions<br>(1)   | Quick Reference<br>(1)   | Wood Screw M4 × 16<br>(2)   | Clamper<br>(1)  |
|  |  |  |  |  |  |  |  |

### 2. Installing the Receiver

- The receiver can be installed only on the corner shown in Fig. A. Consider the direction where the panel is attached to the indoor unit.

#### 1 Remove the air inlet grille Indoor unit electric component box

#### 2 Remove the corner cover.

- Remove the screw fixing the corner cover.

- Place a hand on both the right and left convex parts of the corner cover to remove it.

#### 3 Wire the receiver.

- Hang the string of the receiver on the pin of the ceiling panel.

- Pass the wiring from the wireless receiver section into the slit. (See "Wiring for the Receiver")

- Fix the wiring with the clamper (supplied) while leaving enough length of wiring to remove the receiver.

- When attaching the filter chamber, cut the clamper (a), and attach the receiver.

#### 4 Fix the receiver.

- Fit the receiver to the ceiling panel so the 5 claws are properly set, and fix it with the removed screw.

- Make sure the wire is not caught.
- Refer to the installation instructions supplied with the panel.

### 3. Wiring the Receiver

#### • Wiring Diagram

#### • Connections

Connect the wires from the receiver to the remote controller terminal strip on the indoor unit. (Polarity does not matter)

### 4. Setting for Receiver

- Check the settings of the [S003] DIP switch on the receiver's PCB.

\* Remove the cover from the receiver when performing the PCB settings.

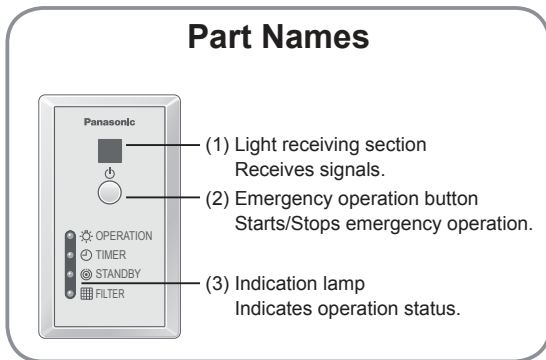

### 5. Setting Address Switches

- When more than 1 receiver is installed in the same room, setting addresses prevents interference.
- For how to change addresses of wireless remote controllers, see the operating instructions of wireless remote controllers.
- To change the receiver's address, remove the cover from the receiver's PCB and set No.1 to No.3 of the [003] DIP switch on PCB.

| Remote Controller Address Display         | Address ALL   | Address 1 | Address 2 | Address 3 | Address 4 | Address 5 | Address 6 | ON/OFF States |
|---|---|-----------|-----------|-----------|-----------|-----------|-----------|---------------|
| Position of the receiver's address switch | Receipt is possible at all of the address positions |           |           |           |           |           |           |               |

## 8-16. CZ-RWSC3

### Installation Instructions Wireless Receiver for ALL

## Safety Precautions

### Read before installation

- Read the Installation Instructions carefully to install the unit correctly and safely.  
Be sure to read the Safety Precautions in particular before installation.
- After the installation is complete, perform test operation to confirm that no abnormality is present.

#### **WARNING**

This symbol refers to a hazard or unsafe practice which can result in severe personal injury or death.

#### **WARNING**

- Turn off the circuit breaker of the units before installation.
- Ask your dealer or professionals for installation and electric work.
- This receiver shall be installed in accordance with National Wiring Regulations.
- Securely connect and fix the specified cables for wiring.
- Do not allow the connection to be exposed to the external force of the cables.
- Choose an installation location that sufficiently supports the weight of the receiver.

### 1. Accessories

| Supplied accessories               |                    |
|------------------------------------|--------------------|
| Wood screw<br>M4 × 15.5<br>(2)<br> | Clamper<br>(1)<br> |

## Dimensions

- We assume no responsibility for accidents or damages resulting from methods other than those described in the installation instructions or methods without using specified parts. Malfunctions that occurred due to the unauthorised installation methods are not covered by the product warranty.
- Read the installation instructions supplied with indoor units as well.

#### **CAUTION**

This symbol refers to a hazard or unsafe practice which can result in personal injury or product or property damage.

#### **CAUTION**

- Do not use at the following locations.
  - Location where condensation occurs
  - Location where flammable gases, etc. may leak
  - Location where corrosive gases, etc. may leak
  - Location with lots of water or oil droplets (including machine oil)
  - Location where voltage fluctuation frequently occurs
  - Location where there is a machine producing electromagnetic radiation
  - Location where droplets of organic solvents spread  
Location where acidic or alkaline solutions or special sprays are frequently used
- Do not operate with wet hands.
- **Do not wash with water.**

## 2. Installing the Receiver

### 1 Remove the bottom case.

### Attention

#### Mounting the bottom case

- Tighten the screws securely until the screw heads touch the bottom case. (Otherwise, loose screw heads may hit the PCB and cause malfunction when mounting the top case.)
- Do not over-tighten the screws. (The bottom case may be deformed, resulting in fall of the unit.)

#### Connecting the remote controller wiring

- Arrange the wires as shown in the illustration for ② in step 2, avoiding unnecessary wires being stored in the case. (Caught wires may destroy the PCB.)
- Avoid wires touching parts on the PCB. (Caught wires may destroy the PCB.)

### 2 Mount to the wall.

#### Exposed type

Preparation: Make 2 holes for screws using a driver.

- 2 Connect the remote controller wiring.**
- Arrange the wires along the groove of the case.

Remove the coating. Approx. 6 mm  
Remove the sheath. Approx. 150 mm  
Make sure the wiring connection is in the correct direction.

#### Embedded type

Preparation: Make 2 holes for screws using a driver.

- 2 Connect the remote controller wiring.**

Remove the coating. Approx. 6 mm

Make sure the wiring connection is in the correct direction.

### 3. Wiring the Receiver

## Wiring for the receiver

■ **Wiring diagram**

■ **Type of wiring**

Use cables of 0.5 to 1.25 mm<sup>2</sup>.

■ **Total wire length:** 400 m or less  
(The wire length between indoor units should be 200 m or less.)

■ **Number of connectable units**

Remote controller and receiver: Max. 2, Indoor unit: Max. 8

### Attention

- Be careful not to connect cables to other terminals of indoor units (e.g. power source wiring terminal). Malfunction may occur.
- Do not bundle together with the power source wiring or store in the same metal tube. Operation error may occur.
- If noise is induced to the unit power supply, attach a noise filter.

- For the RC wiring of field supply, please use insulated wires with sheath. The insulation thickness should be at least 1 mm.
- Regulations on wire diameters differ from locality to locality. For field wiring rules, please refer to your LOCAL ELECTRICAL CODES before beginning.
- You must ensure that installation complies with all relevant rules and regulations.

\*Wiring as shown below is prohibited.

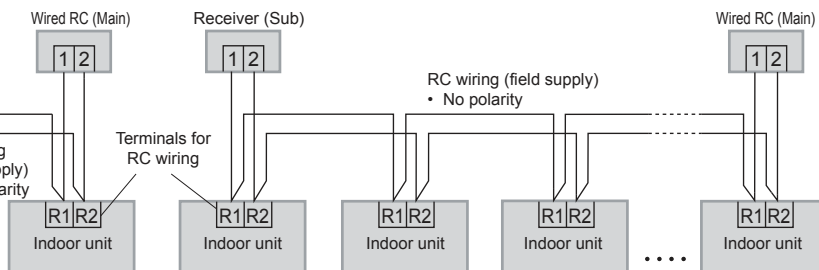

### Installation when setting Main/Sub for the remote controller and the receiver

■ **Using 1 indoor unit**

Installation example

■ **Using more than 1 indoor unit**

After installation, according to the "Main/Sub setting" in the "Setting" section, set one to [Main] and the other to [Sub].  
Setting the wired remote controller to [Main] is recommended.

### Note

The remote controller and the receiver can be connected to any indoor unit for operation.

## Specifications

|                            |   |
|----------------------------|---|
| Model No.                  | CZ-RWSC3  |
| Dimensions                 | (H) 120 mm × (W) 70 mm × (D) 20 mm                                  |
| Weight                     | 75 g  |
| Temperature/Humidity range | 0 °C to 40 °C / 20 % to 80 % (No condensation)<br>*Indoor use only. |
| Power Source               | DC16 V (supplied from indoor unit)                                  |

## 4. Setting Address Switches

- Main/Sub setting
- Address setting

Remove the top case of the receiver for setting.

### Main/Sub setting

- Use this to set Main/Sub for the remote controller and the receiver.
- Set one to [Main] and the other to [Sub].
- Factory default: [Main]
- It is recommended to set the wired remote controller to [Main].

| Main/Sub                 | MAIN    | SUB     |
|--------------------------|---------|---------|
| Main/Sub switch position |         |         |
|                          | 1 2 3 4 | 1 2 3 4 |

### Address setting

- When more than 1 receiver is installed in the same room, setting addresses prevents interference.
- For how to change addresses of wireless remote controllers, see operating instructions of wireless remote controllers.

| Wireless remote controller address display | Address ALL                                     | Address 1 | Address 2 | Address 3 | Address 4 | Address 5 | Address 6 |
|--|---|-----------|-----------|-----------|-----------|-----------|-----------|
| Address switch position                    | Receiving is possible at all address positions. |           |           |           |           |           |           |
|  |   | 1 2 3 4   | 1 2 3 4   | 1 2 3 4   | 1 2 3 4   | 1 2 3 4   | 1 2 3 4   |

## 5. Test operation

Preparation : Turn on the circuit breaker of units and then turn the power on. After the power is turned on, remote controller operation is ignored for approx. 1 minute because setting is being made. This is not malfunction. (Contents received while setting are disabled.)

1. To start test operation, press and hold the emergency operation button for 10 seconds.
2. The indication lamps (OPERATION, TIMER, STANDBY) blink during test operation.
3. To finish test operation, press and hold the emergency operation button for 10 seconds.

### Attention

- Do not use this mode for purposes other than the test operation. (To prevent overload of the units)
- Read the installation instructions supplied with the units.
- Any of the Heat, Cool and Fan operations can only be performed.
- Temperature cannot be changed.
- The test operation mode is automatically turned off in 60 minutes. (To prevent continuous test operation)
- Outdoor units do not operate for approx. 3 minutes after the power is turned on or operation is stopped.

### Self-diagnostics table and detected contents

- The "Alarm Display" as shown in the table below expresses the alarm contents displayed when the wired remote controller is connected. For how to handle the alarms, see installation instructions of indoor units or technical guide.

| Detected contents   | Alarm Display              | Indication lamp on the receiver |       |         |                |
|---|----------------------------|---------------------------------|-------|---------|----------------|
|   |                            | OPERATION                       | TIMER | STANDBY | Blinking       |
| Communication error in the remote controller circuit  | E01-E03, E08-E14, E17, E18 | □                               | ●     | ●       |                |
| Communication error either in the in/outdoor operation line or the sub-bus of the outdoor unit    | E04-E07, E15, E16, E19-E31 | ●                               | ●     | □       |                |
| Operation of indoor protection device   | P01, P09-P14               | ●                               | □     | □       | Alternately    |
| Operation of outdoor protection device  | P02-P08, P15-P31           | □                               | ●     | □       | Alternately    |
| Error in the indoor thermistor  | F01-F03, F10-F11           | □                               | □     | ●       | Alternately    |
| Error in the outdoor thermistor   | F04-F09, F12-F28           | □                               | □     | ○       | Alternately    |
| Error in the indoor EEPROM  | F29                        | □                               | □     | ●       | Simultaneously |
| Error in the outdoor EEPROM   | F30, F31                   | □                               | □     | ○       | Simultaneously |
| Error related to the compressor   | H01-H31                    | ●                               | □     | ●       |                |
| Error in indoor settings  | L01-L03, L05-L09           | □                               | ●     | □       | Simultaneously |
| Error in outdoor settings   | L04, L10-L31               | □                               | ○     | □       | Simultaneously |
| Inconsistency in Air/Heat (Including an auto-temp setting for a model without auto-temp settings) |                            | ○                               | □     | □       | Alternately    |
| Oil Alarm (Same as operation of outdoor protection device)  |                            | □                               | ●     | □       | Alternately    |
| Test operation  |                            | □                               | □     | □       | Simultaneously |

●: OFF ○: ON (Illuminated) □: Blinking (0.5 seconds interval)

## 8-17. CZ-RWST3N

### 1. Accessories

| Supplied accessories  |   |   |   |  |   |   |   |
|---|---|---|---|--|---|---|---|
| Receiver<br>(1)   | Wireless Remote Controller<br>(1)   | Remote Controller Holder<br>(1)   | LR03 Size Battery<br>(2)  | Operating Instructions<br>(1)  | Quick Reference<br>(1)  | Wood Screw M4 × 16<br>(2)   | Clamper<br>(1)  |
|  |  |  |  |  |  |  |  |

### 2. Installing the Receiver

#### ● Ceiling Suspended Model

- (1) Remove the screw, and slide the latch to open the air-intake grille. (Fig. 8-1)
- (2) Insert a flat-head screwdriver from the side, and remove the cover while pressing down on the two cover tabs. (Fig. 8-2)
- (3) Route the remote controller wiring through the panel, and mount the receiver into the panel holes. (Fig. 8-3)
- (4) Route the remote controller wiring through the adjustable clamper, and draw in the wire from the remote controller wiring inlet to the inside of the indoor unit. (Fig. 8-3) (See Fig. 8-4 for how to loosen the adjustable clamper.)
- (5) Route the remote controller wiring through the three saddles, and draw the wire into the electrical box. (Fig. 8-4)
  - \* Draw in the power wire and remote controller wiring separately.
- (6) Connect the remote controller wiring to the terminal board, route through the cable tie (accessory) to the holding clamp, and secure the remote controller wiring. (Fig. 8-5)
- (7) Mount the side cover, and close the air-intake grille.

Fig. 8-1

Fig. 8-2

Fig. 8-3

Fig. 8-4

Fig. 8-5

## ● Removing and Mounting the Side Cover

### Removing the side cover

Remove the side cover mounting screw, and slide the side cover to the front side (direction of arrow in Fig. 8-6) to remove.

### Mounting the side cover

Slide in the side cover from the indoor unit front side, mount to the latch tabs, and secure using the side cover mounting screw.

Fig. 8-6

## 3. Wiring the Receiver

### Wiring Diagram

### Connections

Connect the wires from the receiver to the remote controller terminal strip on the indoor unit. (Polarity does not matter)

## 4. Test Operation

### Implementing a Test Run

1. Turn the #1 DIP switch [S003] on the receiver's PCB from OFF to ON and operate the wireless remote controller with its Start/Stop button.
2. During a test run, all display lamps on the display will light up.
3. During a test run, it is not possible to adjust the temperature.
4. After completing a test run, be absolutely sure to turn the #1 DIP switch from ON to OFF and make sure none of the display lamps are blinking. Also, replace the PCB cover back as it was and fasten it; while holding the wiring with the cable clamp, tighten its screw.

### NOTE

1. This is hard on the device, so only use this for the test run.
2. After turning on the power, the unit will not receive any commands from the remote controller for about 1 minute. This is not an error. (In fact it does receive signals, but they are cancelled.)

## 5. Setting Address Switches

- When more than one receiver and remote controller are installed in the same room, setting up addresses allows them to avoid interfering with each other.
- Refer to the Users Manual for information on how to change the addresses of the remote controllers.
- Changing the address of a receiver can be done after removing the screw to the receiver's PCB cover. Once the change is complete, put the cover back in place; while holding the wiring with the cable clamp, tighten its screw.

|   |   |          |          |       |          |
|---|---|----------|----------|-------|----------|
| Address Display on the Remote Controller  | <b>AL L</b>   | <b>1</b> | <b>2</b> | ..... | <b>6</b> |
| Position of the Receiver's Address Switch | It doesn't matter where the receiver's address switch is. |          |          | ..... |          |

## 8-18. Common to All Models

### 1. The Self-Diagnosis Function Display and What is Detected

Alarm Display in the table below indicates the content of alarms that are displayed when a wired remote controller is connected. For information on how to deal with the alarms, refer to the Mounting Instructions for the indoor unit or to Test Run or servicing materials.

| Error Detected  | Alarm Display              | WL Remote Controller LED Display |       |         |                |

### 2. Room Temperature Sensor Settings

#### Common to All Models

- The indoor unit and the wireless remote controller are equipped with indoor temperature sensors. The sensing of indoor temperature works via one of them.
- When the unit is shipped, it is set to the indoor unit, but to switch to the remote controller, press the sensor button (diagram at right) inside the remote controller's cover and then check to make sure that Main Sensor on the LCD screen goes off.

Sensor Button

Fig. 8-7

#### NOTE

Even when the Sensor switch has been set to the remote controller, if the unit does not receive any room temperature data from the remote controller for ten minutes, it automatically switches back to the indoor unit sensor, so be sure to install the remote controller facing the receiver.
