| Add gas amount g/m (oz/ft)                                 |   | 50 (0.538)                                 |   |             |                                     |                |            |        |             |        |
| Pipe length for additional gas m (ft)                      |   | 30 (98.4)                                  |   |             |                                     |                |            |        |             |        |

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m<sup>3</sup>/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230V (400V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230V (400V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V (400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season. Other fiche data indicates in an attached sheet.

\*7: Noise and air flow rate of L are indicated by the values at FAN mode. ( ) : Normal operation Cooling/Heating noise value. Normal operation Cooling/Heating air flow rate are 7.6 (m<sup>3</sup>/min).

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.  
\*3: Network Impedance shall be applicable for EUROPE and CHINA models.  
\*4: The annual consumption is calculated by multiplying the input power at 230V (400V) by an average of 500 hours per year in cooling mode.  
\*5: EER and COP classification is at 230V (400V) only in accordance with EU directive 2002/31/EC.  
\*6: SEER and SCOP classification is at 230V (400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season. Other fiche data indicates in an attached sheet.  
\*7: Noise and air flow rate of L are indicated by the values at FAN mode. ( ) : Normal operation Cooling/Heating noise value. Normal operation Cooling/Heating air flow rate are 7.6 (m³/min).

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m<sup>3</sup>/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230V (400V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230V (400V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V (400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.

\*7: Noise and air flow rate of L are indicated by the values at FAN mode. ( ) : Normal operation Cooling/Heating noise value. Normal operation Cooling/Heating air flow rate are 7.6 (m<sup>3</sup>/min).

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m<sup>3</sup>/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.  
\*3: Network Impedance shall be applicable for EUROPE and CHINA models.  
\*4: The annual consumption is calculated by multiplying the input power at 230V (400V) by an average of 500 hours per year in cooling mode.  
\*5: EER and COP classification is at 230V (400V) only in accordance with EU directive 2002/31/EC.  
\*6: SEER and SCOP classification is at 230V (400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.  
\*7: Noise and air flow rate of L are indicated by the values at FAN mode. ( ): Normal operation Cooling/Heating noise value. Normal operation Cooling/Heating air flow rate are 7.6 (m<sup>3</sup>/min).

| Pipe length for additional gas                           |  | m (ft)                                     |  | 30m (98.4)   |                                    |            |            |        |             |        |

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m<sup>3</sup>/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230V (400V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230V (400V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V (400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
 \*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230V shall be used.  
 \*3: Network Impedance shall be applicable for EUROPE and CHINA models.  
 \*4: The annual consumption is calculated by multiplying the input power at 230V(400V) by an average of 500 hours per year in cooling mode.  
 \*5: EER and COP classification is at 230V(400V) only in accordance with EU directive 2002/31/EC.  
 \*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m<sup>3</sup>/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230V(400V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230V(400V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m<sup>3</sup>/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.  
\*3: Network Impedance shall be applicable for EUROPE and CHINA models.  
\*4: The annual consumption is calculated by multiplying the input power at 230V (400V) by an average of 500 hours per year in cooling mode.  
\*5: EER and COP classification is at 230V (400V) only in accordance with EU directive 2002/31/EC.  
\*6: SEER and SCOP classification is at 230V (400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.  
\*7: Noise and air flow rate of L are indicated by the values at FAN mode. ( ): Normal operation Cooling/Heating noise value. Normal operation Cooling/Heating air flow rate are 7.6 (m<sup>3</sup>/min).

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m<sup>3</sup>/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230V (400V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230V (400V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V (400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

\*7: Noise and air flow rate of L are indicated by the values at FAN mode. ( ) : Normal operation Cooling/Heating noise value. Normal operation Cooling/Heating air flow rate are 7.6 (m<sup>3</sup>/min).

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
 \*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.  
 \*3: Network Impedance shall be applicable for EUROPE and CHINA models.  
 \*4: The annual consumption is calculated by multiplying the input power at 230V (400V) by an average of 500 hours per year in cooling mode.  
 \*5: EER and COP classification is at 230V (400V) only in accordance with EU directive 2002/31/EC.  
 \*6: SEER and SCOP classification is at 230V (400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.  
 \*7: Noise and air flow rate of L are indicated by the values at FAN mode. ( ): Normal operation Cooling/Heating noise value. Normal operation Cooling/Heating air flow rate are 7.6 (m³/min).

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m<sup>3</sup>/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230V (400V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230V (400V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V (400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.

\*7: Noise and air flow rate of L are indicated by the values at FAN mode. ( ): Normal operation Cooling/Heating noise value. Normal operation Cooling/Heating air flow rate are 7.6 (m<sup>3</sup>/min).

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
 \*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230V shall be used.  
 \*3: Network Impedance shall be applicable for EUROPE and CHINA models.  
 \*4: The annual consumption is calculated by multiplying the input power at 230V(400V) by an average of 500 hours per year in cooling mode.  
 \*5: EER and COP classification is at 230V(400V) only in accordance with EU directive 2002/31/EC.  
 \*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m<sup>3</sup>/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230V(400V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230V(400V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.

\*1 In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
 \*2 If the EUROVENT Certified models can be operated under the "extra-low"temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230V shall be used.  
 \*3 Network Impedance shall be applicable for EUROPE and CHINA models.  
 \*4 The annual consumption is calculated by multiplying the input power at 230V(400V) by an average of 500 hours per year in cooling mode.  
 \*5 EER and COP classification is at 230V(400V) only in accordance with EU directive 2002/31/EC.  
 \*6 SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet  
 \*7 H: High at setting 5 stage (Level 5), M: Middle at setting 5 stage (Level 3), L: Low at setting 5 stage (Level 1)

| Pipe length for additional gas                           |  | m (ft) 30m (98.4)   |  |            |                                     |              |              |        |      |        |

\*1 In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2 If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230V shall be used.

\*3 Network Impedance shall be applicable for EUROPE and CHINA models.

\*4 The annual consumption is calculated by multiplying the input power at 230V(400V) by an average of 500 hours per year in cooling mode.

\*5 EER and COP classification is at 230V(400V) only in accordance with EU directive 2002/31/EC.

\*6 SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet

\*7 H: High at setting 5 stage (Level 5), M: Middle at setting 5 stage (Level 3), L: Low at setting 5 stage (Level 1)

\*1 In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2 If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230V shall be used.

\*3 Network Impedance shall be applicable for EUROPE and CHINA models.

\*4 The annual consumption is calculated by multiplying the input power at 230V(400V) by an average of 500 hours per year in cooling mode.

\*5 EER and COP classification is at 230V(400V) only in accordance with EU directive 2002/31/EC.

\*6 SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.

\*7 H: High at setting 5 stage (Level 5), M: Middle at setting 5 stage (Level 3), L: Low at setting 5 stage (Level 1)

\*1 In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2 If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230V shall be used.

\*3 Network Impedance shall be applicable for EUROPE and CHINA models.

\*4 The annual consumption is calculated by multiplying the input power at 230V(400V) by an average of 500 hours per year in cooling mode.

\*5 EER and COP classification is at 230V(400V) only in accordance with EU directive 2002/31/EC.

\*6 SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet

\*7 H: High at setting 5 stage (Level 5), M: Middle at setting 5 stage (Level 3), L: Low at setting 5 stage (Level 1)

| Pipe length for additional gas                           |  | m (ft)             |   | 30m (98.4)   |                               |                                     |                |              |        | -    |        |

\*1 In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
 \*2 If the EUROVENT Certified models can be operated under the "extra-low"temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230V shall be used.  
 \*3 Network Impedance shall be applicable for EUROPE and CHINA models.  
 \*4 The annual consumption is calculated by multiplying the input power at 230V(400V) by an average of 500 hours per year in cooling mode.  
 \*5 EER and COP classification is at 230V(400V) only in accordance with EU directive 2002/31/EC.  
 \*6 SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet  
 \*7 H: High at setting 5 stage (Level 5), M: Middle at setting 5 stage (Level 3), L: Low at setting 5 stage (Level 1)

# Single -Type

## 1-1. Unit Specifications

\*1 In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2 If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230V shall be used.

\*3 Network Impedance shall be applicable for EUROPE and CHINA models.

\*4 The annual consumption is calculated by multiplying the input power at 230V(400V) by an average of 500 hours per year in cooling mode.

\*5 EER and COP classification is at 230V(400V) only in accordance with EU directive 2002/31/EC.

\*6 SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.

\*7 H: High at setting 5 stage (Level 5), M: Middle at setting 5 stage (Level 3), L: Low at setting 5 stage (Level 1)

| Add gas amount g/m (oz/ft)                                 |  | 50g (0.538)  |   |               |                                     |                |              |        |        |      |        |
| Pipe length for additional gas m (ft)                      |  | 30m (98.4)   |   |               |                                     |                |              |        |        |      |        |

\*1 In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
 \*2 If the EUROVENT Certified models can be operated under the "extra-low"temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230V shall be used.  
 \*3 Network Impedance shall be applicable for EUROPE and CHINA models.  
 \*4 The annual consumption is calculated by multiplying the input power at 230V(400V) by an average of 500 hours per year in cooling mode.  
 \*5 EER and COP classification is at 230V(400V) only in accordance with EU directive 2002/31/EC.  
 \*6 SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet  
 \*7 H: High at setting 5 stage (Level 5), M: Middle at setting 5 stage (Level 3), L: Low at setting 5 stage (Level 1)

\*1 In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2 If the EUROVENT Certified models can be operated under the "extra-low"temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230V shall be used.

\*3 Network Impedance shall be applicable for EUROPE and CHINA models.

\*4 The annual consumption is calculated by multiplying the input power at 230V(400V) by an average of 500 hours per year in cooling mode.

\*5 EER and COP classification is at 230V(400V) only in accordance with EU directive 2002/31/EC.

\*6 SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.

\*7 H: High at setting 5 stage (Level 5), M: Middle at setting 5 stage (Level 3), L: Low at setting 5 stage (Level 1)

\*1 In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
 \*2 If the EUROVENT Certified models can be operated under the "extra-low"temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230V shall be used.  
 \*3 Network Impedance shall be applicable for EUROPE and CHINA models.  
 \*4 The annual consumption is calculated by multiplying the input power at 230V(400V) by an average of 500 hours per year in cooling mode.  
 \*5 EER and COP classification is at 230V(400V) only in accordance with EU directive 2002/31/EC.  
 \*6 SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.  
 \*7 H: High at setting 5 stage (Level 5), M: Middle at setting 5 stage (Level 3), L: Low at setting 5 stage (Level 1)

\*1 In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2 If the EUROVENT Certified models can be operated under the "extra-low"temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230V shall be used.

\*3 Network Impedance shall be applicable for EUROPE and CHINA models.

\*4 The annual consumption is calculated by multiplying the input power at 230V(400V) by an average of 500 hours per year in cooling mode.

\*5 EER and COP classification is at 230V(400V) only in accordance with EU directive 2002/31/EC.

\*6 SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet

\*7 H: High at setting 5 stage (Level 5), M: Middle at setting 5 stage (Level 3), L: Low at setting 5 stage (Level 1)

\*1 In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
 \*2 If the EUROVENT Certified models can be operated under the "extra-low"temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230V shall be used.  
 \*3 Network Impedance shall be applicable for EUROPE and CHINA models.  
 \*4 The annual consumption is calculated by multiplying the input power at 230V(400V) by an average of 500 hours per year in cooling mode.  
 \*5 EER and COP classification is at 230V(400V) only in accordance with EU directive 2002/31/EC.  
 \*6 SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.  
 \*7 H: High at setting 5 stage (Level 5), M: Middle at setting 5 stage (Level 3), L: Low at setting 5 stage (Level 1)

\*1 In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2 If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230V shall be used.

\*3 Network Impedance shall be applicable for EUROPE and CHINA models.

\*4 The annual consumption is calculated by multiplying the input power at 230V(400V) by an average of 500 hours per year in cooling mode.

\*5 EER and COP classification is at 230V(400V) only in accordance with EU directive 2002/31/EC.

\*6 SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.

\*7 H: High at setting 5 stage (Level 5), M: Middle at setting 5 stage (Level 3), L: Low at setting 5 stage (Level 1)

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
 \*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.  
 \*3: Network Impedance shall be applicable for EUROPE and CHINA models.  
 \*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.  
 \*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.  
 \*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230V (400V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230V (400V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V (400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

# Simultaneous (Twin) -Type

## 1-1. Unit Specifications

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
 \*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.  
 \*3: Network Impedance shall be applicable for EUROPE and CHINA models.  
 \*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.  
 \*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.  
 \*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230V (400V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230V (400V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V (400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

# Single -Type

## 1-1. Unit Specifications

**PEY1**

### 8. Ceiling Type S-100PT2E5A / U-100PEY1E5

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
 \*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.  
 \*3: Network Impedance shall be applicable for EUROPE and CHINA models.  
 \*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.  
 \*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.  
 \*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
 \*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.  
 \*3: Network Impedance shall be applicable for EUROPE and CHINA models.  
 \*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.  
 \*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.  
 \*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
 \*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.  
 \*3: Network Impedance shall be applicable for EUROPE and CHINA models.  
 \*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.  
 \*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.  
 \*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.

|   | Pipe length for additional gas                      | m (ft)   |                              |             | 30 (98.4)                           |                |             | -    |        |      |

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
 \*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.  
 \*3: Network Impedance shall be applicable for EUROPE and CHINA models.  
 \*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.  
 \*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.  
 \*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

# Single -Type

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

| Pipe length for additional gas  |  | m (ft)   |                              |             | 30 (98.4)                           |                |            | -    |        |       |

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
 \*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.  
 \*3: Network Impedance shall be applicable for EUROPE and CHINA models.  
 \*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.  
 \*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.  
 \*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

| Add gas amount g/m (oz/ft)            |   | 50 (0.538)                                |  |         | -          |                                     |            | -    |        |       |
| Pipe length for additional gas m (ft) |   | 30 (98.4)                                 |  |         | -          |                                     |            | -    |        |       |

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
 \*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.  
 \*3: Network Impedance shall be applicable for EUROPE and CHINA models.  
 \*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.  
 \*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.  
 \*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230V (400V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230V (400V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V (400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
 \*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.  
 \*3: Network Impedance shall be applicable for EUROPE and CHINA models.  
 \*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.  
 \*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.  
 \*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.

| Pipe length for additional gas m (ft)                      |  | 30m (98.4)                                       |  |              |  |            |              |        |      |        |   |

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

# Single -Type

## 1-1. Unit Specifications

**PEY1**

### 10. Low Silhouette Ducted Type S-100PF1E5A / U-100PEY1E5

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
 \*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.  
 \*3: Network Impedance shall be applicable for EUROPE and CHINA models.  
 \*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.  
 \*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.  
 \*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.

| Pipe length for additional gas  |  | m (ft)   |                                    |              | 30 (98.4)                           |                |            | -        |      |        |      |

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
 \*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.  
 \*3: Network Impedance shall be applicable for EUROPE and CHINA models.  
 \*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.  
 \*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.  
 \*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.

| Pipe length for additional gas m (ft)                      |   | 30 (98.4)                              |  |              |             |                                     |             |          |       |        |      |

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
 \*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.  
 \*3: Network Impedance shall be applicable for EUROPE and CHINA models.  
 \*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.  
 \*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.  
 \*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.

# Single -Type

## 1-1. Unit Specifications

**PEY1**

### 10. Low Silhouette Ducted Type S-100PF1E5A / U-100PEY1E8

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
 \*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.  
 \*3: Network Impedance shall be applicable for EUROPE and CHINA models.  
 \*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.  
 \*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.  
 \*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

| Pipe length for additional gas                             |  | m (ft)   |                                    |                    | 30 (98.4)                           |                |             | -        |       |        |

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
 \*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.  
 \*3: Network Impedance shall be applicable for EUROPE and CHINA models.  
 \*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.  
 \*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.  
 \*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.

# Single -Type

## 1-1. Unit Specifications

**PEY2**

### 11. Ducted Type S-71PN1E5A / U-71PEY2E5

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

# Single -Type

| Pipe length for additional gas m (ft)                      | 30 (98.4)                                      |                  |  | -                                   |              |                | -           |      |        |       |  |

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
 \*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.  
 \*3: Network Impedance shall be applicable for EUROPE and CHINA models.  
 \*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.  
 \*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.  
 \*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

# Single -Type

## 1-1. Unit Specifications

**PEY1**

### 11. Ducted Type S-125PN1E5A / U-125PEY1E5

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
 \*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.  
 \*3: Network Impedance shall be applicable for EUROPE and CHINA models.  
 \*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.  
 \*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.  
 \*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.

# Single -Type

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

# Single -Type

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
 \*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.  
 \*3: Network Impedance shall be applicable for EUROPE and CHINA models.  
 \*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.  
 \*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.  
 \*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.

# Single -Type

## 1-1. Unit Specifications

**PEY1**

### 11. Ducted Type S-140PN1E5A / U-140PEY1E8

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230 V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230 V (400 V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230 V (400 V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.  
 \*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230V shall be used.  
 \*3: Network Impedance shall be applicable for EUROPE and CHINA models.  
 \*4: The annual consumption is calculated by multiplying the input power at 230V(400V) by an average of 500 hours per year in cooling mode.  
 \*5: EER and COP classification is at 230V(400V) only in accordance with EU directive 2002/31/EC.  
 \*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

\*1: In case it is necessary to indicate the air flow volume in (l/s), the value in (m³/min.) shall be multiplied by 16.7 and rounded down the decimal point.

\*2: If the EUROVENT Certified models can be operated under the "extra-low" temperature condition, -7°C dry bulb and -8°C wet-bulb temperatures with rated voltage 230V shall be used.

\*3: Network Impedance shall be applicable for EUROPE and CHINA models.

\*4: The annual consumption is calculated by multiplying the input power at 230V(400V) by an average of 500 hours per year in cooling mode.

\*5: EER and COP classification is at 230V(400V) only in accordance with EU directive 2002/31/EC.

\*6: SEER and SCOP classification is at 230V(400V) only in accordance with EN-14825. For heating, SCOP indicates the value of only Average heating season, Other fiche data indicates in an attached sheet.

(A) Indoor Units: S-36PU2E5A / S-45PU2E5A / S-50PU2E5A / S-60PU2E5A / S-71PU2E5A

unit: mm

Raise dimension of drain tube

The length of the suspension bolts should be selected so that there is a gap of 30 mm or more below the lower surface of the ceiling (18 mm or more below the lower surface of the main unit), as shown in the figure at right. If the suspension bolt is too long, it will contact the ceiling panel and the unit cannot be installed.

|   |   |
|---|---|
| ① | Air intake grille                                     |
| ② | Air outlet  |
| ③ | Refrigerant piping (liquid pipe) $\phi 6.35$ (flared) |
| ④ | Refrigerant piping (gas pipe) $\phi 12.7$ (flared)    |
| ⑤ | Drain tube connection port VP25 (outer $\phi 32$ )    |
| ⑥ | Power supply entry                                    |
| ⑦ | Suspension bolt hole (4-11 x 26 slot)                 |
| ⑧ | Fresh air intake duct connection port ( $\phi 80$ )   |

Adjust the suspension bolt length so that the gap from the lower ceiling surface becomes 45mm or more, as shown in the figure at right. If the suspension bolts is too long, it will contact the ceiling panel and the unit cannot be installed.

## 1-4. Operating Range

### Type PE1

|         | Temperature | Indoor air intake temp. | Outdoor air intake temp. |
|---------|-------------|-------------------------|--------------------------|
| Cooling | Maximum     | 32°C DB / 25°C WB       | 46°C DB                  |
|         | Minimum     | 18°C DB / 14°C WB       | -15°C DB                 |
| Heating | Maximum     | 30°C DB / – WB          | 24°C DB / 18°C WB        |
|         | Minimum     | 16°C DB / – WB          | -20°C DB / -20°C WB      |

### Type PEY1

|         | Temperature | Indoor air intake temp. | Outdoor air intake temp. |
|---------|-------------|-------------------------|--------------------------|
| Cooling | Maximum     | 32°C DB / 25°C WB       | 43°C DB                  |
|         | Minimum     | 18°C DB / 14°C WB       | -10°C DB                 |
| Heating | Maximum     | 30°C DB / – WB          | 24°C DB / 18°C WB        |
|         | Minimum     | 16°C DB / – WB          | -15°C DB / -15°C WB      |

### Type PE2

|         | Temperature | Indoor air intake temp. | Outdoor air intake temp. |
|---------|-------------|-------------------------|--------------------------|
| Cooling | Maximum     | 32°C DB / 25°C WB       | 46°C DB                  |
|         | Minimum     | 18°C DB / 14°C WB       | -15°C DB                 |
| Heating | Maximum     | 30°C DB / – WB          | 24°C DB / 18°C WB        |
|         | Minimum     | 16°C DB / – WB          | -20°C DB / -20°C WB      |

### Type PEY2

|         | Temperature | Indoor air intake temp. | Outdoor air intake temp. |
|---------|-------------|-------------------------|--------------------------|
| Cooling | Maximum     | 32°C DB / 25°C WB       | 43°C DB                  |
|         | Minimum     | 18°C DB / 14°C WB       | -10°C DB                 |
| Heating | Maximum     | 30°C DB / – WB          | 24°C DB / 18°C WB        |
|         | Minimum     | 16°C DB / – WB          | -15°C DB / -15°C WB      |

1-5. Capacity Correction Graph According to Temperature Condition

PE2

U-36PE2E5A (For 50 Hz)

Cooling capacity ratio (maximum capacity)

Heating capacity ratio (maximum capacity)

Cooling

Heating

Outdoor unit heating capacity correction coefficient during of frosting/defrosting (RH approximately 85%)

|                                      |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |
|--------------------------------------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| Outdoor intake air temperature °C WB | -20.0 | -19.0 | -18.0 | -17.0 | -16.0 | -15.0 | -14.0 | -13.0 | -12.0 | -11.0 | -10.0 | -9.0  | -8.0  | -7.0  | -6.0  | -5.0  | -4.0  | -3.0  | -2.0  |
| Correction coefficient               | 0.966 | 0.966 | 0.962 | 0.958 | 0.954 | 0.946 | 0.945 | 0.940 | 0.935 | 0.930 | 0.925 | 0.920 | 0.915 | 0.915 | 0.905 | 0.900 | 0.895 | 0.890 | 0.874 |

|                                      |       |       |       |       |       |       |       |       |       |
|--------------------------------------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| Outdoor intake air temperature °C WB | -1.0  | 0.0   | 1.0   | 2.0   | 3.0   | 4.0   | 5.0   | 6.0   | 7.0   |
| Correction coefficient               | 0.888 | 0.902 | 0.916 | 0.930 | 0.944 | 0.958 | 0.972 | 0.986 | 1.000 |

To calculate the heating capacity with consideration for frosting/defrosting operation, multiply the heating capacity found from the capacity graph by the correction coefficient from the table above.

REMARKS:

- Value obtained in the actual place where the unit is installed may be slightly higher than the values shown in this graph because of the conditions of operation, the structure of the building, the background noise and other factors.
- The test results were obtained from an anechoic room.

NOTE

To evaluate "Noise level" the maximum number of the measured OCTAVE BAND SOUND PRESSURE LEVEL is used. Read the number on each BAND CENTER FREQUENCIES (horizontal axis) ranging from 63 Hz to 8000 Hz and select the maximum value (vertical axis) among them.

**1-7. Indoor Fan Performance**

External Static Pressure Setting for AC Fan Motor Model

To apply to following models

■ S-36PN1E5A , S-45PN1E5A , S-50PN1E5A

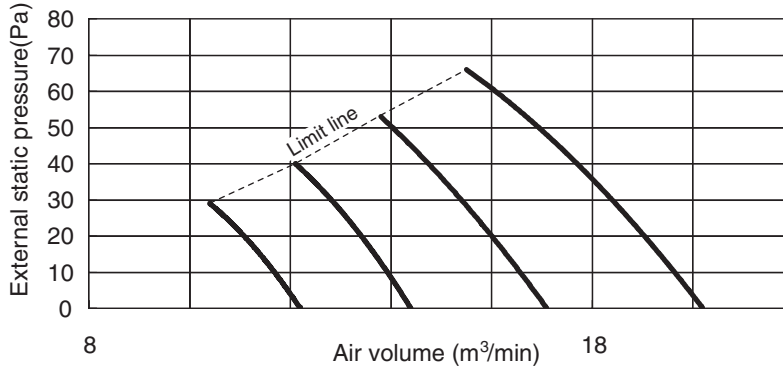

There are two tap connector located in indoor unit control box can be selected.

The "blue connector" is standard tap ,use-as-is at shipment.

For high static pressure duct ,switch Fan Motor connector to plug in boost tap

"white connector" to elevate air volume.

## 1-9. Fresh Air Intake

### 1-9-1. Precautions Regarding External Air Intake

#### (1) Ventilation Load

Ensure that the design of the air-conditioner takes air-conditioning loads into consideration when external air intake is involved.

#### (2) Restrictions on External Air Intake

Ensure that the design conforms to the restrictions on air intake volume stipulated in accordance with the model of the indoor unit and the intake method. Consideration must also be taken to mixed air content listed in (3) below without fail.

\* If the air intake volume does not satisfy the required ventilation volume, air must be fed into the room separately with the use of a total heat exchanger or a fresh air processing air-conditioner, etc.

#### (3) Mixed Air

The amount of external air intake must be set within the scope of the unit's usage conditions when external air and internal air is mixed together. This is especially important in the following cases, in which it is necessary to either feed external air into the room after it has been processed or reduce the amount of external air that is fed in.

① When the external dew-point temperature is greater than the dry-bulb temperature of the air sucked into the unit  
Ensure that processing is performed so that the external dew-point temperature is lower than the temperature of the air sucked into the unit to prevent the risk of condensation building up.

② In the case of low external temperatures

There are cases in which the temperature of mixed air is lower than the operating range of the unit if excessive amounts of external air intake are used when the external temperature is low.

This problem is to be solved by either feeding external air into the room after it has been processed or reducing the amount of external air that is fed in.

③ When used in combination with humidifiers

External air must always be processed when the external air temperature reaches freezing point to prevent the risk of the humidifier freezing.

#### (4) Arranging Ducts and Filters in the Field

External air intake ducting must be arranged in the field.

External air filters must also be installed without fail in order to prevent the intake of dust and grit.

#### (5) Thermal Insulation for Ducts

Ensure that all external air intake ducting is heat-insulated without fail. Failure to observe this may result in the build-up of condensation.

#### (6) External Air Intake Coupling

Ensure that the design for external air intake is coupled with the fan blower operations of the indoor unit.

There are cases in which the dust that accumulates in the filter is blown into the room if the external air is fed from the filter. There are also cases in which the noise of external air being fed into the room can be heard from the indoor unit if external air is forcibly fed when the booster fan or other components on the indoor unit are not operating.

#### (7) Booster Fan Selection

Select the booster fan in accordance with the resistance of the external air intake duct (diagram on the pressure loss characteristics of the air flow volume for flexible cylindrical ducts) and the resistance prevalent inside the unit (external air intake volume & resistance within unit / operation noise characteristics).

#### (8) Attaching the External Air Intake Flange

Regarding the installation direction of the external air intake duct, refer to the Installation Instructions provided with the external air intake duct.

Air Flow Volume for Flexible Cylindrical Duct-Pressure Loss

External Air Intake Volume and Resistance and Operation Noise Characteristics within the Unit

With the External Air Intake Flange Attached

- Calculate the operation noise when external air is being fed by combining the noise when only external air is being fed as shown in the graph for operation noise characteristics and the operation noise of the unit as stipulated in the catalogue.
- The operation noise conforms to JIS standards and constitute measurements taken in an anechoic chamber 1.5 m directly beneath the indoor unit. Under normal circumstances, the values shown here are greater owing to the effects of surrounding noise and reverberation when the unit is actually installed.

The amount of external air that is possible to feed when it is fed directly into the unit (ø100)

| Type                                 | 36 | 45 | 50 | 60 | 71 | 100 | 125 | 140 |
|--------------------------------------|----|----|----|----|----|-----|-----|-----|
| Permissible Air Intake Volume (m³/h) | 13 | 15 | 15 | 17 | 18 | 18  | 18  | 18  |

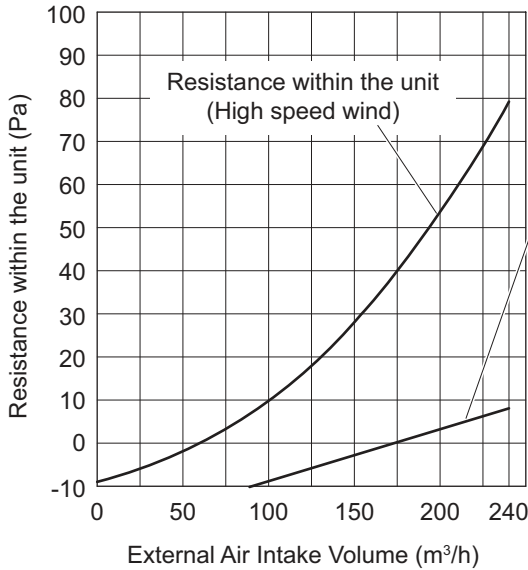

**NOTE**

The operation noise for models that use small units is lower, so use values that are within the range shown in the above table. Using values that exceed these will result in noise when only external air is fed being louder than the noise emitted from the unit.

**CAUTION** Use the following diagram along with the section "1-9-1. Precautions Regarding External Air Intake"

1-9-2-1. In a Case of External Air Intake Using Air Intake Chamber (CZ-FDU3+CZ-ATU2)

**External Air Intake Volume & Resistance Within Unit/  
Operation Noise Characteristics**

**With the External Air Intake Chamber Attached**

1. Calculate the operation noise when external air is being fed by combining the noise when only external air is being fed as shown in the diagram for operation noise characteristics and the operation noise of the unit as stipulated in the catalogue.
2. The operation noise conforms to JIS standards and constitute measurements taken in an anechoic chamber 1.5m directly below the indoor unit. Under normal circumstances, the diagram shown above is greater owing to the effects of surrounding noise and reverberation when the unit is actually installed.

The amount of external air that is possible to feed when external air intake chamber is in use (CZ-FDU3+CZ-ATU2)

| Type                                 | 36  | 45  | 50  | 60  | 71  | 100 | 125 | 140 |
|--------------------------------------|-----|-----|-----|-----|-----|-----|-----|-----|
| Permissible air intake volume (m³/h) | 180 | 180 | 180 | 190 | 240 | 240 | 240 | 240 |

\* The operation noise for models that use small units is lower, so use values that are within the range shown in the above table. Using values that exceed these will result in noise when only external air is fed being louder than the noise emitted from the unit.

● Sample selection of booster fans

In a case of necessity at 200m³/h of external air intake:

1. Resistance within the unit      Diagram from "Resistance within the unit"    55 Pa
2. Duct resistance in case of duct with 4m length

Duct resistance      Diagram from "Air Flow Volume for Flexible Cylindrical Duct-Pressure Loss"      40 Pa    (=10 Pa/m x 4m)

Total 95 Pa

Therefore, a booster is required to save a total 95 Pa of static pressure.

1-9-2. External Air Intake Volume & Resistance Within Unit / Operation Noise Characteristics (continued)

● Ceiling (Type T2)

1-9-2-1. In a Case of External Air Intake to Unit Directly (Using external air intake cylindrical flange)

External Air Intake Volume & Resistance Within Unit/  
Operation Noise Characteristics

With the External Air Intake Flange Attached

1. Calculate the operation noise when external air is being fed by combining the noise when only external air is being fed as shown in the diagram for operation noise characteristics and the operation noise of the unit as stipulated in the catalogue.
2. The operation noise conforms to JIS standards and constitute measurements taken in an anechoic chamber 1m front and 1m below the indoor unit. Under normal circumstances, the diagram shown above is greater owing to the effects of surrounding noise and reverberation when the unit is actually installed.

The amount of external air intake that is possible to feed when it is fed directly into the unit

| Type                                 | 36  | 45  | 50  | 60  | 71  | 100 | 125 | 140 |
|--------------------------------------|-----|-----|-----|-----|-----|-----|-----|-----|
| Permissible air intake volume (m³/h) | 160 | 170 | 170 | 200 | 210 | 240 | 240 | 240 |

\* The operation noise for models that use small units is lower, so use values that are within the range shown in the above table. Using values that exceed these will result in noise when only external air is fed being louder than the noise emitted from the unit.

**1-9-2. External Air Intake Volume & Resistance Within Unit / Operation Noise Characteristics (continued)**

**● Low Silhouette Ducted (Type F1)**

1-9-2-2. In a Case of External Air Intake to Unit Directly (Using external air intake cylindrical flange)

**External Air Intake Volume & Resistance Within Unit/  
Operation Noise Characteristics**

**With the External Air Intake Flange Attached**

1. Calculate the operation noise if external air is being fed by combining the noise when only external air is being fed as shown in the diagram for operation noise characteristics and the operation noise of the unit as stipulated in the catalogue.
2. The operation noise conforms to JIS standards and constitute measurements taken in an anechoic chamber 1.5m directly below the indoor unit. Under normal circumstances, the diagram shown above is greater owing to the effects of surrounding noise and reverberation when the unit is actually installed.

The amount of external air intake that is possible to feed when it is fed directly into the unit

| Type                                 | 36  | 45  | 50  | 60  | 71  | 100 | 125 | 140 |
|--------------------------------------|-----|-----|-----|-----|-----|-----|-----|-----|
| Permissible air intake volume (m³/h) | 126 | 126 | 150 | 180 | 180 | 240 | 240 | 240 |

\* The operation noise for models that use small units is lower, so use values that are within the range shown in the above table. Using values that exceed these will result in noise when only external air is fed being louder than the noise emitted from the unit.

**● 4-Way Cassette 60×60 (Type Y2)**

1-9-2-3. In a Case of External Air Intake to Unit Directly (Using external air intake cylindrical flange (ø80))

- Calculate the operation noise if external air is being fed by combining the noise when only external air is being fed and the operation noise of the unit as stipulated in the catalogue.
- The operation noise conforms to JIS standards and constitute measurements taken in an anechoic chamber 1.5m directly beneath the indoor unit. Under normal circumstances, the values shown here are greater owing to the effects of surrounding noise and reverberation when the unit is actually installed.

The amount of external air that is possible to feed when it is fed directly into the unit (ø80)

| Type                                 | 36 | 45 | 50 |
|--------------------------------------|----|----|----|
| Permissible Air Intake Volume (m³/h) | 10 | 10 | 10 |

**NOTE**

Using values that exceed these will result in noise when only external air is fed being louder than the noise emitted from the unit.

## 1-10. Electrical Wiring

- U-36PE2E5A, U-50PE2E5A, U-60PE2E5A  
U-60PEY2E5, U71PEY2E5

### ■ General Precautions on Wiring

- (1) Before wiring, confirm the rated voltage of the unit as shown on its nameplate, then carry out the wiring closely following the wiring diagram.

- (2) This equipment is strongly recommended to be installed with Earth Leakage Circuit Breaker (ELCB) or Residual Current Device (RCD). Otherwise, it may cause electrical shock and fire in case of equipment breakdown or insulation breakdown. Earth Leakage Circuit Breaker (ELCB) must be incorporated in the fixed wiring in accordance with the wiring regulations. The Earth Leakage Circuit Breaker (ELCB) must be an approved 10-16 A, having a contact separation in all poles.
- (3) To prevent possible hazards from insulation failure, the unit must be grounded.
- (4) Each wiring connection must be done in accordance with the wiring system diagram. Wrong wiring may cause the unit to disorder or become damaged.
- (5) Do not allow wiring to touch the refrigerant tubing, compressor, or any moving parts of the fan.
- (6) Unauthorized changes in the internal wiring can be very dangerous. The manufacturer will accept no responsibility for any damage or malfunction that occurs as a result of such unauthorized changes.
- (7) Regulations on wire diameters differ from locality to locality. For field wiring rules, please refer to your LOCAL ELECTRICAL CODES before beginning.  
You must ensure that installation complies with all relevant rules and regulations.
- (8) To prevent malfunction of the air conditioner caused by electrical noise, care must be taken when wiring as follows:
  - The remote control wiring and the inter-unit control wiring should be wired apart from the inter-unit power wiring.
  - Use shielded wires for inter-unit control wiring between units and ground the shield on both sides.
- (9) If the power supply cord of this appliance is damaged, it must be replaced by a repair shop designated by the manufacturer, because special-purpose tools are required.

### ■ Recommended Wire Length and Wire Diameter for Power Supply System

#### Outdoor unit

|            | (A) Power supply    |             | Time delay fuse or circuit capacity | (A) Power supply  |             | Time delay fuse or circuit capacity | Ssc      |
|------------|---------------------|-------------|-------------------------------------|-------------------|-------------|-------------------------------------|----------|
|            | Wire size           | Max. length |                                     | Wire size         | Max. length |                                     |          |
| U-36PE2E5A | 2.5 mm <sup>2</sup> | 22 m        | 20 A                                | 4 mm <sup>2</sup> | 35 m        | 20 A                                | *1       |
| U-50PE2E5A | 2.5 mm <sup>2</sup> | 22 m        | 20 A                                | 4 mm <sup>2</sup> | 35 m        | 20 A                                | *1       |
| U-60PE2E5A | 2.5 mm <sup>2</sup> | 17 m        | 25 A                                | 4 mm <sup>2</sup> | 27 m        | 25 A                                | 2893 kVA |
| U-60PEY2E5 | 2.5 mm <sup>2</sup> | 17 m        | 25 A                                | 4 mm <sup>2</sup> | 27 m        | 25 A                                | 2893 kVA |
| U-71PEY2E5 | 2.5 mm <sup>2</sup> | 17 m        | 25 A                                | 4 mm <sup>2</sup> | 27 m        | 25 A                                | 2893 kVA |

\*1 U-36PE2E5A and U-50PE2E5A meet the technical requirements of EN/IEC 61000-3-2.

#### Indoor unit

| Type               | (B) Power supply    | Time delay fuse or circuit capacity |
|--------------------|---------------------|-------------------------------------|
|                    | 2.5 mm <sup>2</sup> |                                     |
| K1                 | Max. 150 m          | 10-16 A                             |
| U2, Y2, T2, F1, N1 | Max. 130 m          | 10-16 A                             |

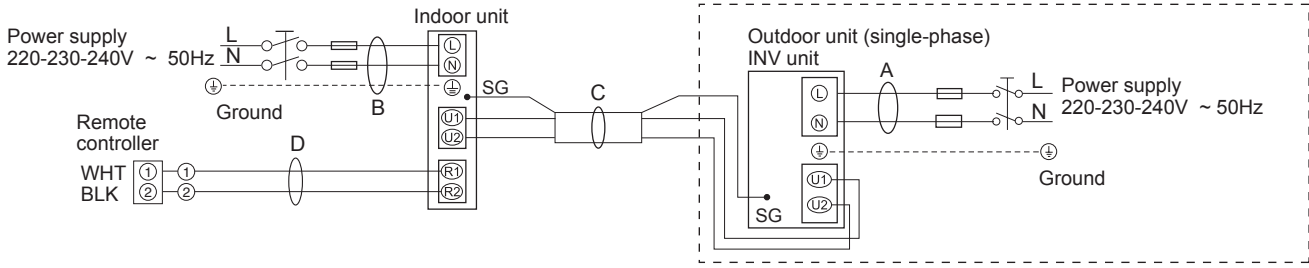

#### Control wiring

| (C) Inter-unit (between outdoor and indoor units) control wiring | (D) Remote control wiring                             |
|--|---|
| 0.75 mm <sup>2</sup> (AWG #18)<br>Use shielded wiring*1          | 0.75 mm <sup>2</sup> (AWG #18)<br>Use shielded wiring |
| Max. 1,000 m   | Max. 500 m  |

#### NOTE

\*1 With ring-type wire terminal.

## ■ Wiring System Diagrams

(SG : Shows the ground for the shielded cable.)

### NOTE

- (1) See the section “■ Recommended Wire Length and Wire Diameter for Power Supply System” for the explanation of “A”, “B”, “C” and “D” in the above diagrams.
- (2) The basic connection diagram of the indoor unit shows the terminal board, so the terminal boards in your equipment may differ from the diagram.
- (3) Refrigerant Circuit (R.C.) address should be set before turning the power on.
- (4) Regarding R.C. address setting, refer to the installation instructions supplied with the remote controller unit (Optional). Auto address setting can be executed by remote controller automatically. Refer to the installation instructions supplied with the remote controller unit (optional).

### ■ Wiring sample

**CAUTION**

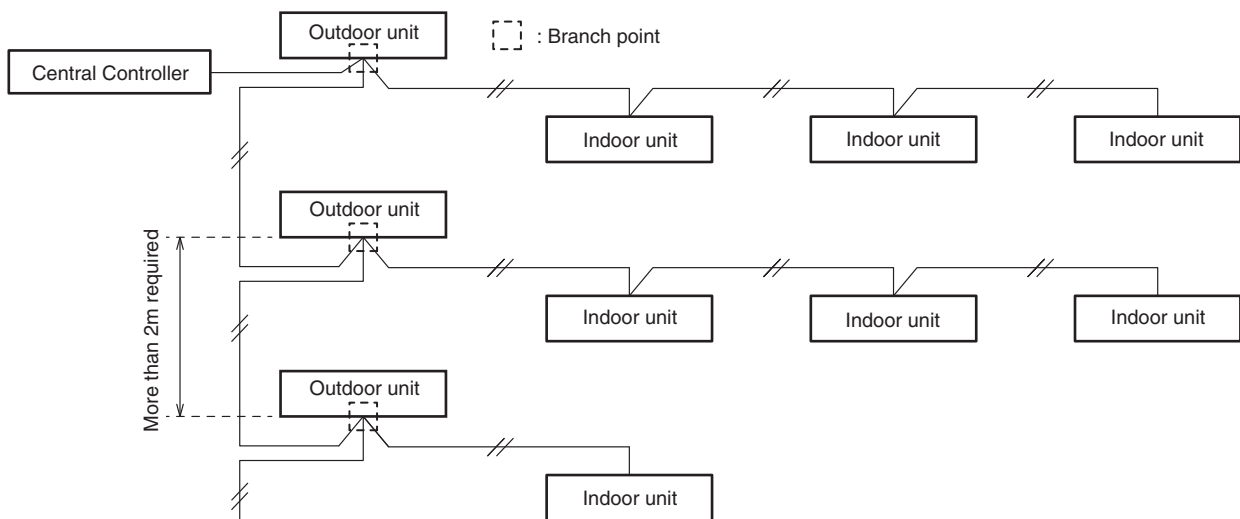

- (1) When linking the outdoor units in a network, disconnect the terminal extended from the short plug from all outdoor units except any one of the outdoor units.  
(When shipping: In shorted condition.)  
For a system without link (no wiring connection between outdoor units), do not remove the short plug.
- (2) Do not install the inter-unit control wiring in a way that forms a loop.

- (3) Do not install inter-unit control wiring such as star branch wiring. Star branch wiring causes mis-address setting.

- (4) If branching the inter-unit control wiring, the number of branch points should be 16 or fewer.

- (5) Use shielded wires for inter-unit control wiring (C) and ground the shield on both sides, otherwise misoperation from noise may occur. Connect wiring as shown in Section "■ Wiring System Diagrams".

- (6) Use the standard power supply cables for Europe (such as H05RN-F or H07RN-F which conform to CENELEC (HAR) rating specifications) or use the cables based on IEC standard. (60245 IEC57, 60245 IEC66)
- Connecting cable between indoor unit and outdoor unit shall be approved polychloroprene sheathed 5 or 3 \*1.5 mm<sup>2</sup> flexible cord. Type designation 60245 IEC 57 (H05RN-F, GP85PCP etc.) or heavier cord.

**WARNING**

Loose wiring may cause the terminal to overheat or result in unit malfunction. A fire hazard may also occur. Therefore, ensure that all wiring is tightly connected.

When connecting each power wire to the terminal, follow the instructions on "How to connect wiring to the terminal" and fasten the wire securely with the terminal screw.

## How to connect wiring to the terminal

### ■ For stranded wires

- (1) Cut the wire end with cutting pliers, then strip the insulation to expose the stranded wire about 10 mm and tightly twist the wire ends.

- (2) Using a Phillips head screwdriver, remove the terminal screw(s) on the terminal board.  
 (3) Using a ring connector fastener or pliers, securely clamp each stripped wire end with a ring pressure terminal.  
 (4) Put the removed terminal screw through the ring pressure terminal and then replace and tighten the terminal screw using a screwdriver.

### ■ Assembling parts for outdoor unit cover

■ U-71PE1E5A ~ U-140PE1E5A, U-71PE1E8A ~ U-140PE1E8A  
 U-100PEY1E5, U-125PEY1E5, U-100PEY1E8, U-125PEY1E8, U-140PEY1E8

**ELECTRICAL WIRING**

|                  |   |
|------------------|---|
| <b>⚠ WARNING</b> | This air conditioner must be installed in accordance with national wiring regulations.  |
|                  | Cables connected to outdoor unit must be approved polychloroprene sheathed type 60245 IEC 57 or H05RN-F/H07RN-F or heavier.   |
|                  | The units must be connected to the supply cables for fixed wiring by qualified technician. Circuit breaker must be incorporated in the fixed wiring in accordance with the national wiring regulations. The circuit breaker must be approved, suitable for the voltage and current ratings of equipment and have a contact separation by 3mm in all poles. When the supply cable is damaged, it must be replaced by qualified technician. |
|                  | Be sure to install a current leakage breaker, main switch and fuse to the main power supply, otherwise electric shocks may result.  |
|                  | Be sure to connect the unit to secure earth connection. If the earthing work is not carried out properly, electric shocks may result.    |
|                  | Wiring shall be connected securely by using specified cables and fix them securely so that external force of the cables may not transfer to the terminal connection section. Imperfect connection and fixing leads to fire, etc.  |

- Ensure to connect the electrical cable connections and clamp the wires securely to the terminal connections using cord clamps so that no undue force is placed on the wires (power source cable, indoor/outdoor connection cables, earth lead wire).
- Do not install a phase advance capacitor for power factor improvement. (It does not improve the power factor and will cause abnormal overheating.)
- Do not bind the excess cables together and place them inside this unit.
- Protect the electrical cable with the protective bushing provided so that the cables do not get damaged on the knock hole or etched portions. If there is space between the electrical cables and the protective bushing occurs, seal it accordingly.
- Tie the cables with the provided binding strap so that they do not touch the compressor and the pipes.
- When setting up the cables, inside of unit install properly so that the front panel will not lift up. Make sure that front panel mount correctly.
- Use a round type terminal with an insulation sleeve for connecting to the terminal block.
- Use the appropriate screwdriver for tightening the terminal screws. Small sized screwdriver damages the head of the screw and cannot tighten it properly.
- There is risk of damaging the screw if the terminal screw is over tightened. Tighten with the appropriate torque.

| Screw diameter name | Tightening torque N•m {kgf•m} |
|---------------------|-------------------------------|
| M4                  | 1.57 ~ 1.96 {0.16 ~ 0.2}      |
| M5                  | 1.96 ~ 2.45 {0.2 ~ 0.25}      |

- Direction to pull out wires

Seal wiring holes after wiring using included protection bush. (other holes are for connecting conduit pipe)

- Earth lead wire set up

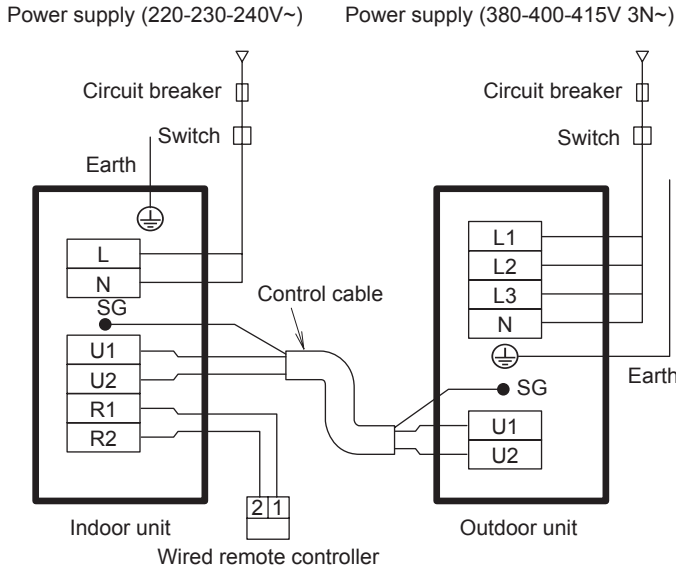

The earth lead wire shall be longer than other lead wires as shown in the figure for electrical safety in case it slips out of the cord from the anchorage.

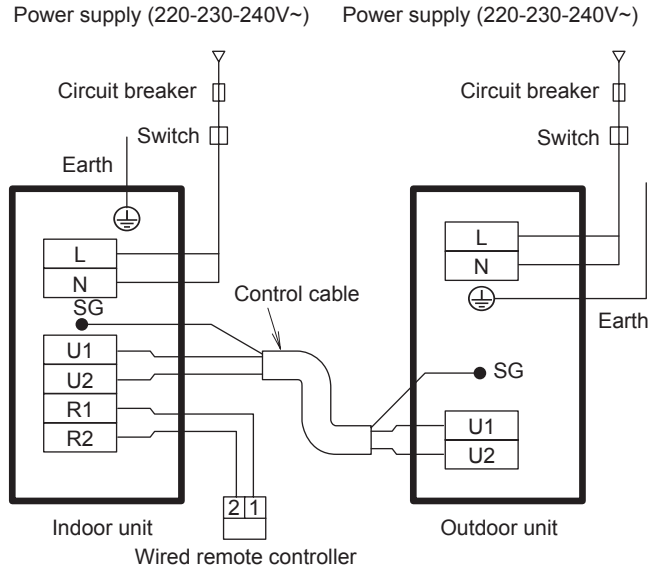

- Be sure to connect the wires correctly to terminal board with connecting the crimp type ring terminal to the wires.
- If connecting two separate wires to a single crimped terminal, place the two crimped terminal wires together as shown in Fig. A. (If the arrangement shown in Fig. B is used, poor contacts or contact damage may result.)

OUTDOOR UNIT/3-PHASE MODEL

OUTDOOR UNIT/SINGLE-PHASE MODEL

This equipment complies with EN/IEC 31000-3-12 provided that the short-circuit power  $S_{sc}$  is greater than or equals to \*2 kVA at the interface point between the user's supply and the public system. It is the responsibility of the installer or user of the equipment to ensure; by consultation with the distribution network operator if necessary that the equipment is connected only to supply with a short-circuit power  $S_{sc}$  greater than or equals to \*2 kVA.

$S_{sc}$ : Short circuit power

SG : Shows the earth for the shielded cable.

| Model name  | Power supply (single-phase) | Maximum electric current (A) | *1 Control cable (mm <sup>2</sup> ) | *2 $S_{sc}$ (kVA) | Model name  | Power supply (3N~) | Maximum electric current (A) | *1 Control cable (mm <sup>2</sup> ) | *2 $S_{sc}$ (kVA) |

| U-125PEY1E5 | 220-230-240V~               | 29                           | 0.75                                | 5800              | U-125PEY1E8 | 380-400-415V       | 10                           | 0.75                                | *3                |
|             |                             |                              |                                     |                   | U-140PEY1E8 | 380-400-415V       | 10                           | 0.75                                | *3                |

\*1 Use a shielded cable for the control cable. Overall extension less than 500m

\*3 The following models are intended for professional use.

U-71PE1E8A, U-100PE1E8A, U-125PE1E8A, U-140PE1E8A, U-100PEY1E8, U-125PEY1E8, U-140PEY1E8

Consult with the supply utility for permission of electrical connection.

- Decide the length and size of the power supply cable based on the maximum ampere tabulated above in accordance with the national wiring regulations.
- Select the fuse(s) and/or circuit breaker(s) from the types and ratings suitable for the maximum ampere tabulated above in accordance with the national wiring regulations.
- If capacity of power supply circuit and enforcement are not enough, it can causes the electric shock and a fire.

For the shield part of the shielded cable, twist the end out, crimp it with a round terminal, and connect it to the SG screw. After crimping it with a round terminal, wrap it with insulating tape so there are no spaces and adjust it so the shield part does not touch any live parts.

**CAUTION** Be sure that the shield part of the shielded cable does not touch the terminal block or any live parts. Failure to do so may lead to electric shock or fire.

## Electrical Wiring

### ■ General Precautions on Wiring

- (1) Before wiring, confirm the rated voltage of the unit as shown on its nameplate, then carry out the wiring closely following the wiring diagram.
- (2) Provide a power outlet to be used exclusively for each unit and a circuit breaker for overcurrent protection should be provided in the exclusive line.
- (3) To prevent possible hazards from insulation failure, the unit must be grounded.
- (4) Each wiring connection must be done in accordance with the wiring system diagram. Wrong wiring may cause the unit to misoperate or become damaged.
- (5) Do not allow wiring to touch the refrigerant tubing, compressor, or any moving parts of the fan.
- (6) Unauthorized changes in the internal wiring can be very dangerous. The manufacturer will accept no responsibility for any damage or misoperation that occurs as a result of such unauthorized changes.
- (7) Regulations on wire diameters differ from locality to locality. For field wiring rules, please refer to your LOCAL ELECTRICAL CODES before beginning.

You must ensure that installation complies with all relevant rules and regulations.

- (8) To prevent malfunction of the air conditioner caused by electrical noise, care must be taken when wiring as follows:
  - The remote control wiring and the inter-unit control wiring should be wired apart from the inter-unit power wiring.
  - Use shielded wires for inter-unit control wiring between units and ground the shield on both sides.
- (9) If the power supply cord of this appliance is damaged, it must be replaced by a repair shop designated by the manufacturer, because special-purpose tools are required.

**CAUTION** Check local electrical codes and regulations before wiring. Also, check any specified instruction or limitations.

### ■ Recommended Wire Length and Wire Diameter for Power Supply System

#### Indoor unit

| Type | (B) Power supply    | Time delay fuse or circuit capacity |
|------|---------------------|-------------------------------------|
|      | 2.5 mm <sup>2</sup> |                                     |
| U2   | Max. 130 m          | 10-16 A                             |
| Y2   | Max. 130 m          | 10-16 A                             |

#### Indoor unit

| Type   | (B) Power supply    | Time delay fuse or circuit capacity |
|--------|---------------------|-------------------------------------|
|        | 2.5 mm <sup>2</sup> |                                     |
| K1     | Max. 150 m          | 10A                                 |
| F1     | Max. 130 m          | 10A                                 |
| T2, N1 | Max. 130 m          | 10-16A                              |

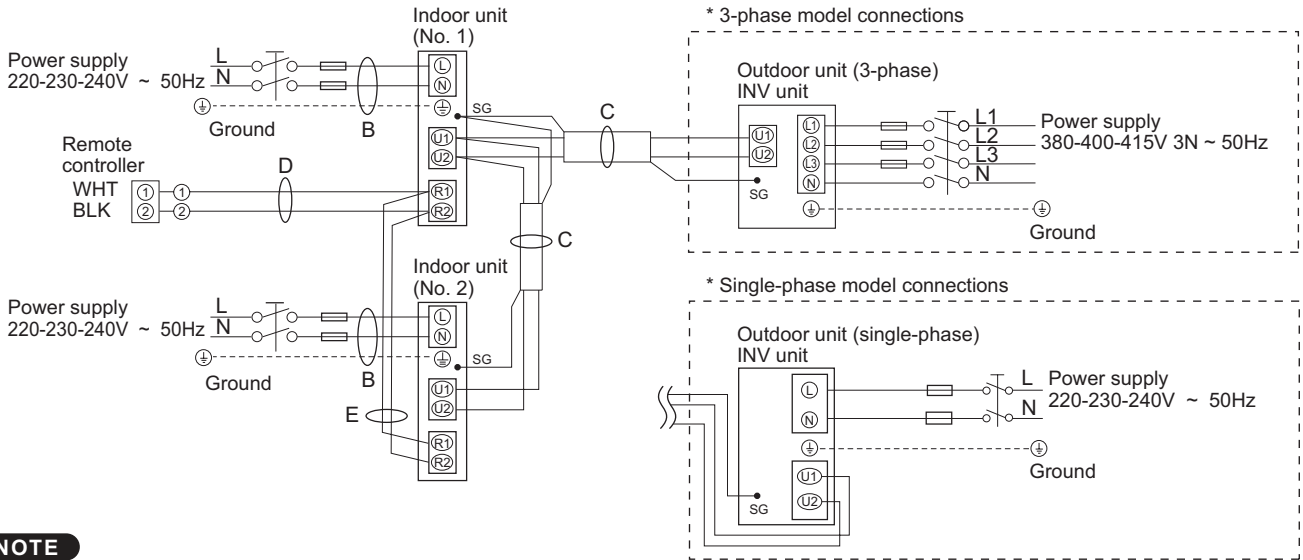

#### Control wiring

| (C) Inter-unit (between outdoor and indoor units) control wiring | (D) Remote control wiring      | (E) Control wiring for group control |
|--|--------------------------------|--------------------------------------|
| 0.75 mm <sup>2</sup> (AWG #18)<br>Use shielded wiring*           | 0.75 mm <sup>2</sup> (AWG #18) | 0.75 mm <sup>2</sup> (AWG #18)       |
| Max. 1,000 m   | Max. 500 m                     | Max. 200 m (Total)                   |

**NOTE**

\* With ring-type wire terminal.

■ Wiring System Diagrams

**NOTE**

- (1) Refer to “Recommended Wire Length and Wire Diameter for Power Supply System” for the explanation of “B”, “C”, “D” and “E” in the above diagram.
- (2) The basic connection diagram of the indoor unit shows the terminal boards, so the terminal boards in your equipment may differ from the diagram.
- (3) Refrigerant Circuit (R.C.) address should be set before turning the power on.
- (4) Regarding R.C. address setting, refer to the installation instructions supplied with the remote controller (optional). Auto address setting can be executed by remote controller automatically. Refer to the installation instructions supplied with the remote controller (optional).

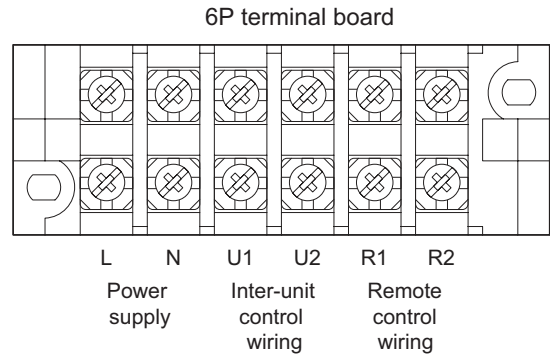

Terminal Board

**Type Y2**

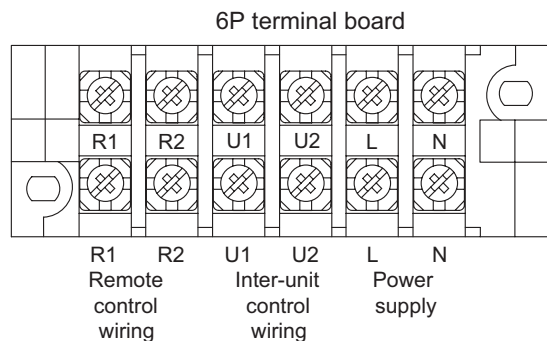

**Type U2**

**Type T2, F1**

**Type K1**

**Type N1**

**CAUTION**

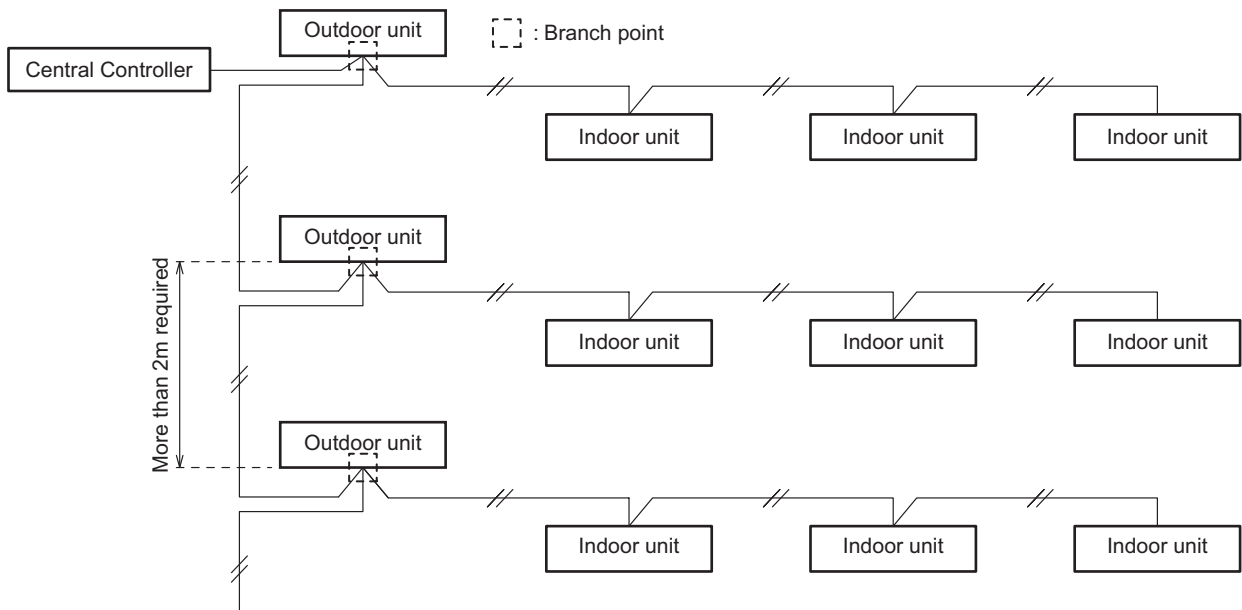

- (1) When linking the outdoor units in a network, disconnect the terminal extended from the short plug from all outdoor units except any one of the outdoor units.  
(When shipping: In shorted condition.)  
For a system without link (no wiring connection between outdoor units), do not remove the short plug.
- (2) Do not install the inter-unit control wiring in a way that forms a loop.

- (3) Do not install inter-unit control wiring such as star branch wiring. Star branch wiring causes mis-address setting.

- (4) If branching the inter-unit control wiring, the number of branch points should be 16 or fewer.

- (5) Use shielded wires for inter-unit control wiring (c) and ground the shield on both sides, otherwise misoperation from noise may occur.

Connect wiring as shown in Section "■ Wiring System Diagrams".

- (6) • Connecting cable between indoor unit and outdoor unit shall be approved polychloroprene sheathed 5 or 3 \*1.5 mm<sup>2</sup> flexible cord. Type designation 60245 IEC 57 (H05RN-F, GP85PCP etc.) or heavier cord.
- Use the standard power supply cables for Europe (such as H05RN-F or H07RN-F which conform to CENELEC (HAR) rating specifications) or use the cables based on IEC standard. (60245 IEC57, 60245 IEC66)

**WARNING**

Loose wiring may cause the terminal to overheat or result in unit malfunction. A fire hazard may also occur. Therefore, ensure that all wiring is tightly connected.

When connecting each power wire to the terminal, follow the instructions on "How to connect wiring to the terminal" and fasten the wire securely with the terminal screw.

## How to connect wiring to the terminal

### ■ For stranded wiring

- (1) Cut the wire end with cutting pliers, then strip the insulation to expose the stranded wiring about 10 mm and tightly twist the wire ends. (Fig. 1-10-1)
- (2) Using a Phillips head screwdriver, remove the terminal screw(s) on the terminal plate.
- (3) Using a ring connector fastener or pliers, securely clamp each stripped wire end with a ring pressure terminal.
- (4) Place the ring pressure terminal, and replace and tighten the removed terminal screw using a screwdriver. (Fig. 1-10-2)

Fig. 1-10-1

Fig. 1-10-2

### ■ Examples of shield wires

- (1) Remove cable coat not to scratch braided shield. (Fig. 1-10-3)
- (2) Unbraid the braided shield carefully and twist the unbraided shield wires tightly together. Insulate the shield wires by covering them with an insulation tube or wrapping insulation tape around them. (Fig. 1-10-4)
- (3) Remove coat of signal wire. (Fig. 1-10-5)
- (4) Attach ring pressure terminals to the signal wires and the shield wires insulated in Step (2). (Fig. 1-10-6)

Fig. 1-10-3

Fig. 1-10-5

Fig. 1-10-6

### ■ Wiring samples

#### Type U2

\*1 Fasten tightly.

Ground terminal fixing for SG  
(SG: Shows the ground for the shielded cable.)

■ Wiring samples

Type T2

Remote control wiring and inter-unit control wiring inlet port

\* Insert the remote control wiring and inter-unit control wiring into the electrical component box from the inlet port as shown in the figure. This is done regardless of whether the wiring was inserted from the top, rear, or left side of the main unit.

Type K1

\* As to functional ground screw and protective ground screw, remove the fixture screw and resin cover. Then, carry out earth ground work.

How to carry out power supply wiring

(1) Wiring connection ports

The power inlet port is located at the rear.  
The remote control wiring inlet port is located at the rear (for use with the wired remote controller).

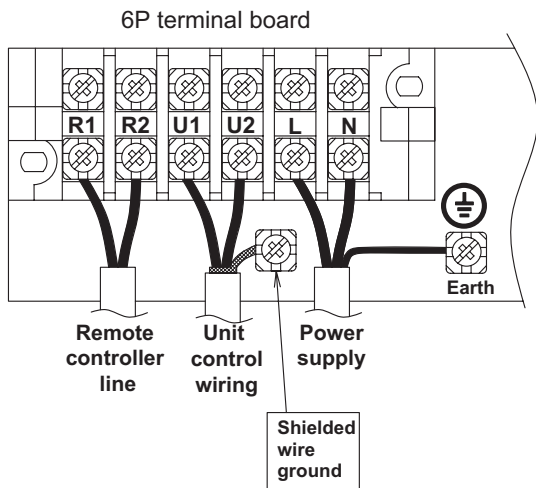

(2) How to carry out wiring

- Insert the power wiring into the indoor unit through the rubber at the side of the electrical component box.
- For wiring connection to the outdoor unit and remote control wiring, open the elongated hole of the piping cover and pass the wires through the hole.

**NOTE**

Be sure to use sealing putty to seal off the opening to prevent dust.

Type N1

Type F1

Use this screw when connecting the shield for the Inter-unit control wiring to ground.

Type Y2

1-11. Installation instructions

1. U-36PE2E5A, U-50PE2E5A, U-60PE2E5A, U-60PEY2E5, U-71PEY2E5

ACCESSORIES SUPPLIED WITH OUTDOOR UNIT

| Part Name              | Figure  | Q'ty | Remarks | Part Name                 | Figure  | Q'ty | Remarks                    |
|------------------------|---|------|---------|---------------------------|---|------|----------------------------|
| Operating Instructions |  | 1    |         | Installation Instructions |  | 1    | Included this instructions |

SELECTING THE INSTALLATION SITE

AVOID:

- heat sources and exhaust fans, etc.
- damp, humid or uneven locations.

DO:

- choose a place as cool as possible.
- choose a place that is well ventilated and outside air temperature does not exceed maximum 45°C constantly.
- allow enough room around the unit for air intake/exhaust and possible maintenance.
- use lug bolts or equal to bolt down unit, reducing vibration and noise.
- If cooling operation is to be used when the outdoor air temperature is -5°C or below, install a duct on the outdoor unit.

Installation space for outdoor unit

Install the outdoor unit with a sufficient space around the outdoor unit for operation and maintenance.

(A) When an obstruction is present on the air inlet side

- When the upward area is open

(1) One outdoor unit installed individually  
Obstruction only on air inlet side

Obstruction on both sides

(2) Two or more outdoor units installed side by side  
Obstructions on both sides

- When an obstruction is present also in the upward area (Do not use the air-discharge chamber.)

(1) One outdoor unit installed individually  
Obstruction only on air inlet side

Obstruction also on the air inlet side and both sides

(2) Two or more outdoor units installed side by side  
Obstruction also on the air inlet side and both sides

|   |                  |
|---|------------------|
| a | 400 mm or more   |
| b | 1,000 mm or more |
| c | 250 mm or more   |
| d | 250 mm or more   |
| e | 500 mm or less   |
| f | 1,000 mm or more |

(B) When an obstruction is present on the air outlet side

● When the upward area is open

(1) One outdoor unit installed individually

|   |                |
|---|----------------|
| a | 500 mm or more |
|---|----------------|

\* When also using the air-discharge chamber, provide a space of 500 mm or more.

● When an obstruction is present also in the upward area

(1) One outdoor unit installed individually

|   |                |
|---|----------------|
| a | 500 mm or more |
| b | 500 mm or less |
| c | 300 mm or more |

(2) Two or more units installed side by side

|   |                  |
|---|------------------|
| a | 1,000 mm or more |
| b | 250 mm or more   |
| c | 250 mm or more   |

(2) Two or more units installed side by side

|   |                  |
|---|------------------|
| a | 500 mm or more   |
| b | 250 mm or more   |
| c | 250 mm or more   |
| d | 500 mm or less   |
| e | 1,000 mm or more |

(C) When an obstruction is present on both the air inlet and air outlet sides

Case 1: When an obstruction on the air outlet side is higher than the outdoor unit ( $L > H$ )  
(There is no height restriction on the air inlet side.)

● When the upward area is open

(1) One outdoor unit installed individually

|   |                |
|---|----------------|
| a | 50 mm or more  |
| b | 500 mm or more |

\* When using the air-discharge chamber, provide a space of 300 mm or more.

(2) Two or more units installed side by side

|   |                  |
|---|------------------|
| a | 200 mm or more   |
| b | 1,000 mm or more |
| c | 250 mm or more   |
| d | 250 mm or more   |

● When an obstruction is present also in the upward area (Do not use the air-discharge chamber.)

(1) One outdoor unit installed individually

|   |                  |
|---|------------------|
| a | 200 mm or more   |
| b | 500 mm or less   |
| c | 1,000 mm or more |

The dimensional relationship between H, A, and L is as shown in the following table.

| Unit: mm   |   |     |
|------------|---|-----|
|            | L   | A   |
| $L \leq H$ | $0 < L \leq 1/2H$                         | 300 |
|            | $1/2H < L \leq H$                         | 500 |
| $H < L$    | Install the frame to achieve $L \leq H$ . |     |

Close the area under the frame so that the outlet air does not bypass there.

(2) Only two outdoor units installed side by side

|   |                  |
|---|------------------|
| a | 200 mm or more   |
| b | 500 mm or less   |
| c | 1,000 mm or more |

The dimensional relationship between H, A, and L is as shown in the following table.

| Unit: mm   |   |     |
|------------|---|-----|
|            | L   | A   |
| $L \leq H$ | $0 < L \leq 1/2H$                         | 500 |
|            | $1/2H < L \leq H$                         | 750 |
| $H < L$    | Install the frame to achieve $L \leq H$ . |     |

Close the area under the frame so that the outlet air does not bypass there.

Only two outdoor units can be installed side by side.

Case 2: When an obstruction on the air outlet side is lower than the outdoor unit ( $L \leq H$ )  
(There is no height restriction on the air inlet side.)

● When the upward area is open

(1) One outdoor unit installed individually

|   |                |
|---|----------------|
| a | 100 mm or more |
| b | 500 mm or more |

\* When using the air-discharge chamber, provide a space of 300 mm or more.

(2) Two or more units installed side by side

|   |                |
|---|----------------|
| a | 200 mm or more |
| b | 500 mm or more |
| c | 250 mm or more |
| d | 250 mm or more |

● When an obstruction is present also in the upward area (Do not use the air-discharge chamber.)

(1) One outdoor unit installed individually

|   |                  |
|---|------------------|
| a | 500 mm or more   |
| b | 500 mm or less   |
| c | 1,000 mm or more |

The dimensional relationship between H, A, and L is as shown in the following table.

| Unit: mm   |   |  |
|------------|---|--|
|            | A   |  |
| $L \leq H$ | 100                                       |  |
| $H < L$    | Install the frame to achieve $L \leq H$ . |  |

Close the area under the frame so that the outlet air does not bypass there.

(2) Only two outdoor units installed side by side

|   |                  |
|---|------------------|
| a | 1,000 mm or more |
| b | 500 mm or less   |
| c | 1,000 mm or more |

The dimensional relationship between H, A, and L is as shown in the following table.

| Unit: mm   |   |  |
|------------|---|--|
|            | A   |  |
| $L \leq H$ | 200                                       |  |
| $H < L$    | Install the frame to achieve $L \leq H$ . |  |

Close the area under the frame so that the outlet air does not bypass there.

Only two outdoor units can be installed side by side.

(D) When outdoor units are stacked

Only two outdoor units can be stacked.

For drain treatment, a space of at least 400 mm is required between the upper and lower outdoor units.

Close the area A (gap between the upper outdoor unit and lower outdoor unit) so that the outlet air does not bypass there.

(1) Obstruction on the air outlet side

(2) Obstruction on the air inlet side

(E) When outdoor units are installed in rows, such as on a rooftop (L < H)

(1) One outdoor unit installed in each row

(2) Only two outdoor units can be installed side by side.

The dimensional relationship between H, A, and L is as shown in the following table.

Unit: mm

|       | A                            |
|-------|------------------------------|
| L ≤ H | 150                          |
| H < L | Installation is not allowed. |

The values described above are the least space to optimize application performance.

If any service area is needed for service according to field circumstance, obtain enough service space.

**In case of multiple installations**

- Concrete block foundation should be used and well drained. Be sure that the foundation height is kept at least more than 50 mm from the ground.
- Base leg should be fixed by inserting the flat washer (field supply) and single nut (field supply) onto the anchor bolt (M8, field supply). Protrusion length of anchor bolt should be 13 mm or less and fastening height of nut should be 12 mm or less.  
Note: If the anchor bolt is longer and the fastening height of nut is higher, the front panel may be damaged when installing or removing it.
- Use lug bolts or equal to bolt down unit, reducing vibration and noise.

### Air-Discharge Chamber for Top Discharge

Be sure to install the air-discharge chamber in the field when:

- it is difficult to keep a space of min. 50 cm between the air discharge outlet and an obstacle.
- the air discharge outlet is facing a sidewalk and discharged hot air annoys passers-by.

In regions with significant snowfall, the outdoor unit should be provided with a platform and snow-proof duct.

### Installing the Unit in Heavy Snow Areas

In locations with strong wind, snow-proof ducting should likewise be fitted and direct exposure to the wind should be avoided as much as possible.

#### ■ Countermeasures against snow and wind

In regions with snow and strong wind, the following problems may occur when the outdoor unit is not provided with a platform and snow-proof ducting:

- The outdoor fan may not run and damage of the unit may be caused.
- There may be no airflow.
- The tubing may freeze and burst.
- The condenser pressure may drop because of strong wind, and the indoor unit may freeze.

### Precautions for Installation in Heavy Snow Areas

- (1) The platform should be higher than the maximum snow depth +50 cm.
- (2) The 2 anchoring feet of the outdoor unit should be used for the platform, and the platform should be installed beneath the air intake side of outdoor unit.
- (3) The platform foundation must be firm and the unit must be secured with anchor bolts.
- (4) In case of installation on a roof subject to strong wind, countermeasures must be taken to prevent the unit from being blown over.

### Dimensions of Snow / Wind-proof Ducting and Refrigerant Tubing Space for Installation

## Tubing Size

### (A) Single type

- Refrigerant tubing between the indoor and outdoor units should be kept as short as possible.
- The lengths of the refrigerant tubes between the indoor and outdoor units are limited by the elevation difference between the 2 units. During tubing work, try to make both the tubing length (L) and the difference in elevation (H1) as short as possible.

| Outdoor unit type                            | U-36PE2E5A<br>U-50PE2E5A | U-60PE2E5A<br>U-60PEY2E5<br>U-71PEY2E5 |
|--|--------------------------|--|
| Maximum allowable tubing length              | 40 m                     | 40 m                                   |
| Charge-less tubing length<br>(actual length) | 3 – 30 m                 | 3 – 30 m                               |
| Additional charge per 1 m                    | 20 g                     | 40 g                                   |

### Tubing Data for Models

| Tubing Data  |                               | Models   | U-36PE2E5A<br>U-50PE2E5A | U-60PE2E5A<br>U-60PEY2E5<br>U-71PEY2E5 |
|--|-------------------------------|----------|--------------------------|--|
| Tubing size outer diameter                           | Liquid tube                   | mm (in.) | 6.35 (1/4)               | 9.52 (3/8)                             |
|  | Gas tube                      | mm (in.) | 12.7 (1/2)               | 15.88 (5/8)                            |
| Limit of tubing length                               |                               | (m)      | 40                       | 40                                     |

## ■ Check of Density Limit

Check the amount of refrigerant in the system and floor space of the room according to the legislation on refrigerant drainage. If there is no applicable legislation, follow the standards described below.

The room in which the air conditioner is to be installed requires a design that in the event of refrigerant gas leaking out, its density will not exceed a set limit.

The refrigerant (R410A), which is used in the air conditioner, is safe, without the toxicity or combustibility of ammonia, and is not restricted by laws imposed to protect the ozone layer. However, since it contains more than air, it poses the risk of suffocation if its density should rise excessively. Suffocation from leakage of refrigerant is almost non-existent. With the recent increase in the number of high density buildings, however, the installation of multi air conditioner systems is on the increase because of the need for effective use of floor space, individual control, energy conservation by curtailing heat and carrying power, etc.

Most importantly, the multi air conditioner system is able to replenish a large amount of refrigerant compared to conventional individual air conditioners. If a single unit of the multi air conditioner system is to be installed in a small room, select a suitable model and installation procedure so that if the refrigerant accidentally leaks out, its density does not reach the limit (and in the event of an emergency, measures can be made before injury can occur).

In a room where the density may exceed the limit, create an opening with adjacent rooms, or install mechanical ventilation combined with a gas leak detection device. The density is as given below.

### Total amount of refrigerant (kg)

#### Min. volume of the indoor unit installed room (m<sup>3</sup>)

#### ≤ Density limit (kg/m<sup>3</sup>)

The density limit of refrigerant which is used in multi air conditioners is 0.44 kg/m<sup>3</sup> (ISO 5149).

#### NOTE

1. The standards for minimum room volume are as follows.

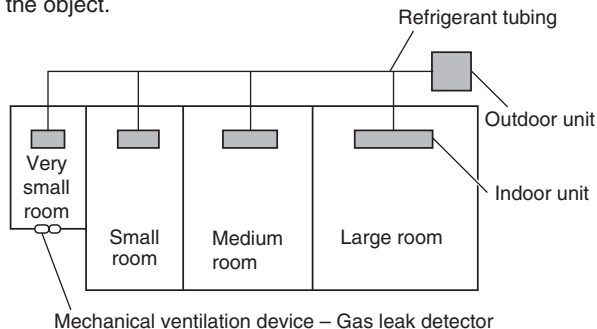

(1) No partition (shaded portion)

(2) When there is an effective opening with the adjacent room for ventilation of leaking refrigerant gas (opening without a door, or an opening 0.15% or larger than the respective floor spaces at the top or bottom of the door).

(3) If an indoor unit is installed in each partitioned room and the refrigerant tubing is interconnected, the smallest room of course becomes the object. But when mechanical ventilation is installed interlocked with a gas leakage detector in the smallest room where the density limit is exceeded, the volume of the next smallest room becomes the object.

2. The minimum indoor floor space compared with the amount of refrigerant is roughly as follows: (When the ceiling is 2.7 m high)

## HOW TO INSTALL THE OUTDOOR UNIT

### Installing the Outdoor Unit

- Use concrete or a similar material to make the base, and ensure good drainage.
- Ordinarily, ensure a base height of 5 cm or more. If a drain pipe is used, or for use in cold-weather regions, ensure a height of 15 cm or more at the feet on both sides of the unit. (In this case, leave clearance below the unit for the drain pipe, and to prevent freezing of drainage water in cold-weather regions.)
- See Fig. 1-11-1-1 for the anchor bolt dimensions.
- Be sure to anchor the feet with anchor bolts (M8). In addition, use anchoring washers on the top side. (Use large square 32 × 32 SUS washers with nominal diameter of 8.) (Field supply)

Unit: mm

Fig. 1-11-1-1

### Drainage Work

The drain water will be discharged from the unit during heating or defrosting operation mode.

Select an appropriate location with good drainage system. (In winter, there is a risk of slipping caused by freezing depending on the installation location.)

- Ensure a height of 15 cm or more at the feet on both sides of the unit.
- Precautions for Installation in Heavy Snow Areas. The platform should be higher than the maximum snow depth. (In this case, leave clearance below the unit for the drain pipe, and to prevent freezing of drainage water in cold-weather regions.)
- When using a drain pipe, install the drain socket (field supply) onto the drain hole. Seal the other drain hole with the rubber cap (field supply). For details, refer to the instruction manual of the drain socket (field supply). After completing the installation work of the drain socket, make sure that the water does not leak from any part of connection.
- In cold regions (where the outdoor temperature can drop to below 0° for 2 to 3 consecutive days), the drain water may freeze and may prevent the fan from operating. For this case, do not use the drain elbow.

### Routing the Tubing and Wiring

- See Fig. 1-11-1-1.

#### CAUTION

- Route the tubing so that it does not contact the compressor, panel, or other parts inside the unit. Increased noise will result if the tubing contacts these parts.
- When routing the tubing, use a tube bender to bend the tubes.
- In cold-weather regions, in order to prevent drainage water from freezing, do not install the drain socket cap. Also take steps to prevent water from accumulating around the unit.

## HOW TO PROCESS TUBING

Both the liquid and the gas tubing sides are connected by flare nuts.

### Connecting the Refrigerant Tubing

#### Use of the Flaring Method

Many of conventional split system air conditioners employ the flaring method to connect refrigerant tubes that run between indoor and outdoor units. In this method, the copper tubes are flared at each end and connected with flare nuts.

#### Flaring Procedure with a Flare Tool

- (1) Cut the copper tube to the required length with a tube cutter. It is recommended to cut approx. 30 – 50 cm longer than the tubing length you estimate.
- (2) Remove burrs at each end of the copper tubing with a tube reamer or a similar tool. This process is important and should be done carefully to make a good flare. Be sure to keep any contaminants (moisture, dirt, metal filings, etc.) from entering the tubing.

#### Deburring

#### NOTE

When reaming, hold the tube end downward and be sure that no copper scraps fall into the tube.

- (3) Remove the flare nut from the unit and be sure to mount it on the copper tube.
- (4) Make a flare at the end of the copper tube with a flare tool.

#### NOTE

A good flare should have the following characteristics:

- inside surface is glossy and smooth
- edge is smooth
- tapered sides are of uniform length

Flare size: A (mm)

| Copper tubing (Outer dia.) | A <sub>-0.4</sub> <sup>0</sup> |
|----------------------------|--------------------------------|
| ø6.35                      | 9.1                            |
| ø9.52                      | 13.2                           |
| ø12.7                      | 16.6                           |
| ø15.88                     | 19.7                           |

#### Caution Before Connecting Tubes Tightly

- (1) Apply a sealing cap or water-proof tape to prevent dust or water from entering the tubes before they are used.
- (2) Be sure to apply refrigerant lubricant to the matching surfaces of the flare and union before connecting them together. This is effective for reducing gas leaks.

- (3) For proper connection, align the union tube and flare tube straight with each other, then screw on the flare nut lightly at first to obtain a smooth match.

- Adjust the shape of the liquid tube using a tube bender at the installation site and connect it to the liquid tubing side valve using a flare.

#### Cautions During Brazing

- Replace air inside the tube with nitrogen gas to prevent copper oxide film from forming during the brazing process. (Oxygen, carbon dioxide and Freon are not acceptable.)
- Do not allow the tubing to get too hot during brazing. The nitrogen gas inside the tubing may overheat, causing refrigerant system valves to become damaged. Therefore allow the tubing to cool when brazing.
- Use a reducing valve for the nitrogen cylinder.
- Do not use agents intended to prevent the formation of oxide film. These agents adversely affect the refrigerant and refrigerant oil, and may cause damage or malfunctions.

## Connecting Tubing Between Indoor and Outdoor Units

- (1) Tightly connect the indoor-side refrigerant tubing extended from the wall with the outdoor-side tubing.
- (2) To fasten the flare nuts, apply specified torque.
  - When removing the flare nuts from the tubing connections, or when tightening them after connecting the tubing, be sure to use a torque wrench and a spanner.

If the flare nuts are over-tightened, the flare may be damaged, which could result in refrigerant leakage and cause injury or asphyxiation to room occupants.

- When removing or tightening the gas tube flare nut, use 2 adjustable wrenches together: one at the gas tube flare nut, and the other at part A.

- For the flare nuts at tubing connections, be sure to use the flare nuts that were supplied with the unit, or else flare nuts for R410A (type 2). The refrigerant tubing that is used must be of the correct wall thickness as shown in the table below.

| Tube diameter | Tightening torque (approx.)           | Tube thickness |
|---------------|---------------------------------------|----------------|
| ø6.35 (1/4")  | 14 – 18 N · m<br>{140 – 180 kgf · cm} | 0.8 mm         |
| ø9.52 (3/8")  | 34 – 42 N · m<br>{340 – 420 kgf · cm} | 0.8 mm         |
| ø12.7 (1/2")  | 49 – 55 N · m<br>{490 – 550 kgf · cm} | 0.8 mm         |
| ø15.88 (5/8") | 68 – 82 N · m<br>{680 – 820 kgf · cm} | 1.0 mm         |

Because the pressure is approximately 1.6 times higher than conventional refrigerant pressure, the use of ordinary flare nuts (type 1) or thin-walled tubes may result in tube rupture, injury, or asphyxiation caused by refrigerant leakage.

- In order to prevent damage to the flare caused by over-tightening of the flare nuts, use the table above as a guide when tightening.
- When tightening the flare nut on the liquid tube, use a adjustable wrench with a nominal handle length of 200 mm.
- When tightening the flare nut with the adjustable wrench, do not apply to the valve stem cap with the other one. If doing so, the valve will be damaged.

- Depending on the installation conditions, applying excessive torque may cause the nuts to crack.

## Precautions for Packed Valve Operation

- If the packed valve is left for a long time with the valve stem cap removed, refrigerant will leak from the valve. Therefore, do not leave the valve stem cap removed.

- Use a torque wrench to securely tighten the valve stem cap.
- Tightening torque:

|                |                          | Tightening torque (approx.)            |
|----------------|--------------------------|--|
| Charging port  |                          | 10.7 – 14.7 N · m {107 – 147 kgf · cm} |
| Valve stem cap | ø6.35 (Liquid side)      | 14.0 – 20.0 N · m {140 – 200 kgf · cm} |
|                | ø9.52 (Liquid side)      | 20.6 – 28.4 N · m {206 – 284 kgf · cm} |
|                | ø12.7, ø15.88 (Gas side) | 48.0 – 59.8 N · m {480 – 598 kgf · cm} |

## Insulating the Refrigerant Tubing

### Tubing Insulation

- Thermal insulation must be applied to all units tubing, including distribution joint (purchased separately).

#### Two tubes arranged together

\* For gas tubing, the insulation material must be heat resistant to 120°C or above. For other tubing, it must be heat resistant to 80°C or above.

Insulation material thickness must be 10 mm or greater.

If the conditions inside the ceiling exceed DB 30°C and RH 70%, increase the thickness of the gas tubing insulation material by 1 step.

#### CAUTION

If the exterior of the outdoor unit valves has been finished with a square duct covering, make sure you allow sufficient space to access the valves and to allow the panels to be attached and removed.

#### Taping the flare nuts

Wind the white insulation tape around the flare nuts at the gas tube connections. Then cover up the tubing connections with the flare insulator, and fill the gap at the union with the supplied black insulation tape. Finally, fasten the insulator at both ends with the supplied vinyl clamps.

### Insulation material

The material used for insulation must have good insulation characteristics, be easy to use, be age resistant, and must not easily absorb moisture.

#### CAUTION

After a tube has been insulated, never try to bend it into a narrow curve because it can cause the tube to break or crack.

Never grasp the drain or refrigerant connecting outlets when moving the unit.

#### Taping the Tubes

- (1) At this time, the refrigerant tubes (and electrical wiring if local codes permit) should be taped together with armoring tape in 1 bundle. To prevent condensation from overflowing the drain pan, keep the drain hose separate from the refrigerant tubing.
- (2) Wrap the armoring tape from the bottom of the outdoor unit to the top of the tubing where it enters the wall. As you wrap the tubing, overlap half of each previous tape turn.
- (3) Clamp the tubing bundle to the wall, using 1 clamp approx. each meter.

#### NOTE

Do not wind the armoring tape too tightly since this will decrease the heat insulation effect. Also ensure that the condensation drain hose splits away from the bundle and drips clear of the unit and the tubing.

## Finishing the Installation

After finishing insulating and taping over the tubing, use sealing putty to seal off the hole in the wall to prevent rain and draft from entering.

## LEAK TEST, EVACUATION AND ADDITIONAL REFRIGERANT CHARGE

Perform an air-tightness test for this package A/C. Check that there is no leakage from any of the connections.

Air and moisture in the refrigerant system may have undesirable effects as indicated below.

- pressure in the system rises
- operating current rises
- cooling (or heating) efficiency drops
- moisture in the refrigerant circuit may freeze and block capillary tubing
- water may lead to corrosion of parts in the refrigerant system

Therefore, the indoor unit and tubing between the indoor and outdoor unit must be leak tested and evacuated to remove any noncondensables and moisture from the system.

Manifold gauge

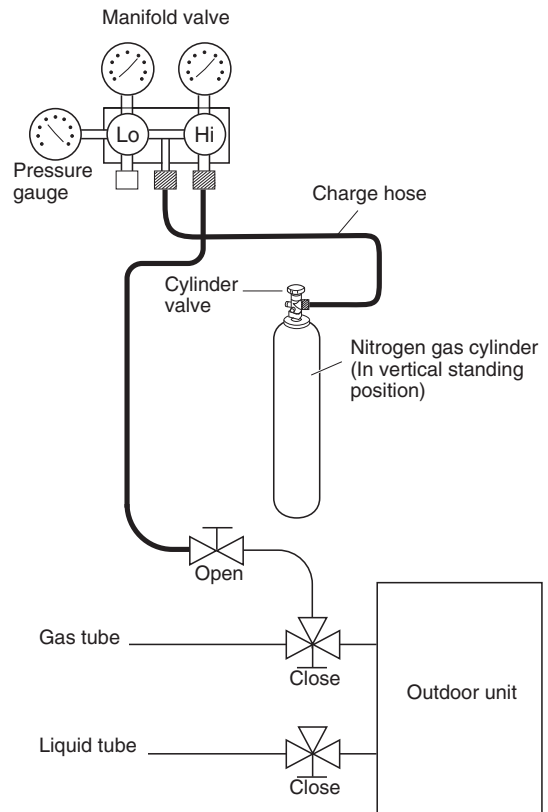

Vacuum pump

### ■ Air Purging with a Vacuum Pump (for Test Run) Preparation

Check that each tube (both liquid and gas tubes) between the indoor and outdoor units has been properly connected and all wiring for the test run has been completed. Remove the valve caps from both the gas and liquid service valves on the outdoor unit. Note that both liquid and gas tube service valves on the outdoor unit are kept closed at this stage.

- The refrigerant charge at the time of shipment is only guaranteed sufficient for a tubing length of up to 30 m. The tubing may exceed this length, up to the maximum permitted length; however, an additional charge is necessary for the amount that the tubing exceeds 30 m. (No additional refrigerating machine oil is needed.)

### Leak Test

- (1) With the service valves on the outdoor unit closed, remove the 6.35 mm flare nut and its bonnet on the gas tube service valve. (Save for reuse.)
- (2) Attach a manifold valve (with pressure gauges) and dry nitrogen gas cylinder to this service port with charge hoses.

**Use a manifold valve for air purging. If it is not available, use a stop valve for this purpose. The “Lo” knob of the manifold valve must always be kept closed.**

- (3) Pressurize the system up to 4.15 MPa {42 kgf/cm<sup>2</sup>G} with dry nitrogen gas and close the cylinder valve when the gauge reading reaches 4.15 MPa {42 kgf/cm<sup>2</sup>G}. Then, test for leaks with liquid soap.

**To avoid nitrogen entering the refrigerant system in a liquid state, the top of the cylinder must be higher than the bottom when you pressurize the system. Usually, the cylinder is used in a vertical standing position.**

- (4) Do a leak test of all joints of the tubing (both indoor and outdoor) and both gas and liquid service valves. Bubbles indicate a leak. Wipe off the soap with a clean cloth after a leak test.
- (5) After the system is found to be free of leaks, relieve the nitrogen pressure by loosening the charge hose connector at the nitrogen cylinder. When the system pressure is reduced to normal, disconnect the hose from the cylinder.

### Evacuation

Be sure to use a vacuum pump that includes a function for prevention of back-flow, in order to prevent back-flow of pump oil into the unit tubing when the pump is stopped.

- Perform vacuuming of the indoor unit and tubing. Connect the vacuum pump to the gas tube valve and apply vacuum at a pressure of  $-101\text{kPa}$   $\{-755\text{ mmHg}, 5\text{ Torr}\}$  or below. Continue vacuum application for a minimum of 1 hour after the pressure reaches  $-101\text{kPa}$   $\{-755\text{ mmHg}, 5\text{ Torr}\}$ .
- (1) Attach the charge hose end described in the preceding steps to the vacuum pump to evacuate the tubing and indoor unit. Confirm that the “Lo” knob of the manifold valve is open. Then, run the vacuum pump.
- (2) When the desired vacuum is reached, close the “Lo” knob of the manifold valve and turn off the vacuum pump. Confirm that the gauge pressure is under  $-101\text{ kPa}$   $\{-755\text{ mmHg}, 5\text{ Torr}\}$  after 4 to 5 minutes of vacuum pump operation.

**CAUTION**

Use a cylinder specifically designed for use with R410A.

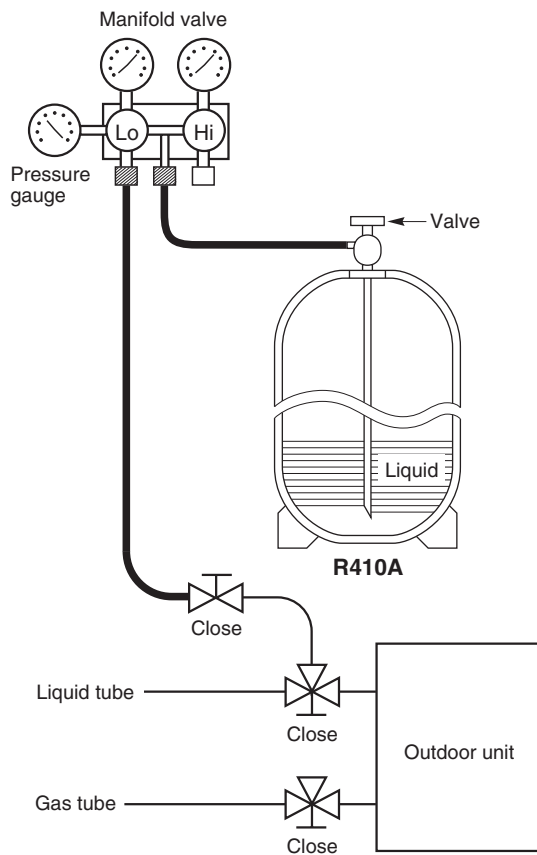

Fig. 1-11-1-2

Fig. 1-11-1-3

### Charging Additional Refrigerant

- Charge additional refrigerant (calculated from the liquid tube length as shown in “Tubing Size” on page 1-11-1-6) using the liquid tube service valve. (Fig. 1-11-1-2)
  - Use a balance to measure the refrigerant accurately.
  - If the additional refrigerant charge amount cannot be charged at once, charge the remaining refrigerant in liquid form by using the gas tube service valve with the system in Cooling mode at the time of test run. (Fig. 1-11-1-3)
- \* If an additional refrigerant charge has been performed, list the refrigerant tubing length and amount of additional refrigerant charge on the product label (inside the panel).

### Finishing the Job

- (1) With a hex wrench, turn the liquid tube service valve stem counterclockwise to fully open the valve.
- (2) Turn the gas tube service valve stem counterclockwise to fully open the valve.

**CAUTION**

To avoid gas from leaking when removing the charge hose, make sure the stem of the gas tube is turned all the way out (“BACK SEAT”) position.

- (3) Loosen the charge hose connected to the gas tube service port (7.94 mm) slightly to release the pressure, and then remove the hose.
- (4) Replace the 7.94 mm flare nut and its bonnet on the gas tube service port and fasten the flare nut securely with an adjustable wrench or box wrench. This process is very important to prevent gas from leaking from the system.
- (5) Replace the valve caps at both gas and liquid service valves and fasten them securely.

| Installation Instructions |      |  | This manual |

### SELECT THE OUTDOOR UNIT INSTALLATION LOCATION

Be careful when picking up and moving the indoor and outdoor units. Get a partner to help, and bend your knees when lifting to reduce strain on your back. Sharp edges or thin aluminum fins on the air conditioner can cut your fingers.

- Install the unit once you have checked that the installation location matches the following conditions.
  - A location with sufficient ventilation.
  - Possibly a location that is sheltered from rain or direct sunlight and is well-ventilated so that hot and cool air does not build up.
  - A location where the area around the discharge is not exposed to animals or plants which could adversely affect the release of hot or cool air from the unit.
  - A location where the discharge and operation noise will not be a nuisance to the neighbours.
  - A location that can support the product's weight or vibrations and secured for horizontal installation wherever possible.
  - A location that does not obstruct the air discharge or intake.
  - A location where there is no danger of flammable or corrosive gas leaks.
  - A location that provides space for installation and service.
  - A location that allows the pipe and cable length fixture for internal and external connections.
  - It may need two or more people to carry out the installation work.
- Refer to the diagram below for the installation location which is exposed to strong wind.
  - If a strong wind of more than 5 m/s blows to the area directly in front of the discharge, the outdoor unit's air flow is reduced and the outflow may re-enter (short circuit) causing the following outcome: "Reduced capacity", "Increased frost formation during heating" or "Operation stopped due to increased pressure".  
Should an exceptionally strong wind blow to the area directly in front of the discharge of the outdoor unit; there is the risk of damage due to the fan's high-speed reverse rotation.
  - If the direction of the prevailing wind is known when operating the unit, place the unit at an appropriate angle to the wind's direction so that the discharge faces towards a building or a wall.

- If installing at locations prone to snowfall, install the unit as high as possible with suitable roofing which shelters the unit from snow.
- Avoid installing the unit in locations where there are petroleum products (such as machine oil), saline content (such as coastal areas), sulphurous gas and where high frequency noise is generated.
- Place the indoor and outdoor unit, power cords and indoor/outdoor unit connection cables at a minimum distance of 1 meter or more away from televisions and radios. This is to avoid interference to picture and/or sound. (However, depending on the electromagnetic waves, noise interference may still occur even with the 1 meter separation.)
- For restaurants and kitchens, avoid installing at locations which draws oil and steam. Plastic parts can deteriorate from droplets of oil and steam or it can cause falling parts or water leakage.
- Avoid installing at the location where cutting oil mist or iron powder is present.
- If there is an immense voltage fluctuation due to the location's problem, ensure to split the power supply.
- When installing the product in a place where it will be affected by typhoon or strong wind such as wind blowing between buildings, including the rooftop of a building and a place where there is no building in surroundings, fix the product with an overturn prevention wire, etc.
- Ensure to assign several people or use a mechanical lift, etc. to transport the unit.

**SELECTING THE LOCATION FOR INSTALLATION SERVICE**

When installing multiple units, allow enough space in between the units and the side of the building.

(A) If there are obstacles at the intake

- If the upper part is open
- ① For separate installation location
  - Only if there are obstacles at the intake

(unit: mm)

- If there are obstacles on both sides

- ② For multiple units (more than 2 units)
  - If there are obstacles on both sides

- If there are obstacles above the unit
- ① For separate installation location
  - Only if there are obstacles at the intake

(unit: mm)

- If there are obstacles on the intake and the other side

- ② For multiple units (more than 2 units)
  - If there are obstacles on both sides

(B) If there are obstacles at the discharge

- If the upper part is open

① For separate installation location

② For multiple units (more than 2 units)

(unit: mm)

- If there are obstacles above the unit

① For separate installation location

② For multiple units (more than 2 units)

(unit: mm)

(C) If there are obstacles on both the intake and discharge

Pattern 1

If there is an obstacle that is higher than the unit on the intake side.  
(There is no limit to the height of the obstacle above the discharge.)

- If the upper part is open

① For separate installation location

② For multiple units (more than 2 units)

(unit: mm)

- If there are obstacles above the unit

① For separate installation location

- The dimensions for H, A and L are shown in the following table.

|       | L   | A   |
|-------|---|-----|
| L ≤ H | 0 < L ≤ 1/2 H                             | 300 |
|       | 1/2 H < L ≤ H                             | 500 |
| H < L | Install a pedestal or mount so that L ≤ H |     |

L > H

(unit: mm)

- Cover the bottom part of the pedestal or mount so that air does not go through it.

② For multiple units (up to 2 units)

- The dimensions for H, A and L are shown in the following table.

|       | L   | A   |
|-------|---|-----|
| L ≤ H | 0 < L ≤ 1/2 H                             | 500 |
|       | 1/2 H < L ≤ H                             | 750 |
| H < L | Install a pedestal or mount so that L ≤ H |     |

- Cover the bottom part of the pedestal or mount so that air does not bypass it.
- A limit of only 2 units can be installed.

**Pattern 2**

If there is an obstacle that is higher than the unit on the discharge side.  
(There is no limit to the height of the obstacle above the discharge.)

- If the upper part is open

(unit: mm)

- ① For separate installation location

**L ≤ H**

- ② For multiple units (more than 2 units)

- If there are obstacles above the unit

- ① For separate installation location

- The dimensions for H, A and L are shown in the following table.

|       |   |
|-------|---|
|       | A   |
| L ≤ H | 100                                       |
| H < L | Install a pedestal or mount so that L ≤ H |

- Cover the bottom part of the pedestal or mount so that air does not go through it.

- ② For multiple units (up to 2 units)

- The dimensions for H, A and L are shown in the following table.

|       |   |
|-------|---|
|       | A   |
| L ≤ H | 200                                       |
| H < L | Install a pedestal or mount so that L ≤ H |

- Cover the bottom part of the pedestal or mount so that air does not bypass it.
- A limit of only 2 units can be installed.

**(D) Stacking installation setup**

- Stack up to 2 tiers.
- A dimension of approximately 400 mm is required for the second tier outdoor unit's drain pipe and space for maintenance of the first tier outdoor unit.
- Close A section (the space between the upper and lower level outdoor units) so the outtake air does not bypass it.

- ① If there are obstacles at the discharge (unit: mm)

- ② If there are obstacles at the intake (unit: mm)

**(E) For multiple row installation (on the roof, etc.)**

- ① For one row installation setup (unit: mm)

(unit: mm)

- ② For multiple units (more than 2 units) (unit: mm)

(unit: mm)

- The dimensions for H, A and L are shown in the following table.

|       |                           |
|-------|---------------------------|
|       | A                         |
| L ≤ H | 200                       |
| H < L | Installation not possible |

- The above mentioned distance is required for optimal unit performance. Allow as much space as possible in order to obtain the best performance from the units.

## TRANSPORT AND INSTALL THE OUTDOOR UNIT

### • Transporting

1. Transport the outdoor unit in its original packaging as close as possible to the installation location.
2. In the event that the unit needs to be lifted or suspended, use a rope or belt and use cloth or wood as padding to avoid damaging the unit.
3. Use the side handles to carry the unit and be careful not to touch the fan with your hand or any objects.

### • Installation

1. Read the "Select the outdoor unit installation location" thoroughly before installing the outdoor unit.
2. When installing to a concrete or solid surface, use M10 or a W 3/8 bolts and nuts to secure the unit. Ensure that it installed upright on a horizontal plane. (Use an anchor bolt for the installation as shown in the diagram at right.)
3. Avoid installing on the slanted roof.
4. In the even where the roof is at risk of receiving oscillations or vibrations, secure the unit with a seismic isolating mount or vibration absorbing rubber.
5. The drain water will be discharged from the unit during heating or defrosting operation mode.

Select an appropriate location with good drainage system. (In the winter, there is risk of slipping due to freezing, and depending on the installation set up there is risk of drain water running overhead.)

× Please consult us if installing drain elbows.

× In cold regions (where the outdoor temperature can drop to below 0° for 2 to 3 consecutive days), the drain water may freeze and may prevent the fan from operating. For this case, do not use the drain elbow.

## REFRIGERANT INSTALLATION

For indoor unit refrigerant piping installation, refer to the Installation Instruction manual that comes with that indoor unit. Do not reuse existing piping, install new piping.

### 1. Precautions during refrigerant installation.

- Use clean pipes with no dust inside.

The pipe may corrode with the presence of fluorine dust which will adversely affect the refrigerant piping system due to deterioration of the refrigerant oil, etc.

- This unit is specifically for R410A. Ensure to adhere to the following items and install accordingly:
  - Use pipe cutters and flaring tools which are specially designed for use with R410A.
  - When connecting with flaring tools, coat the flare section with ether-based oil.
  - Ensure to use flare nuts supplied with the unit when connecting this unit.
  - Only for storing or for open pipes.
  - Set the lower limit of the allowable pipe length to 5m. If the pipe is shorter than 5m, the refrigerant may become overfilled and a problem such as abnormal high pressure could occur.

### 2. The local pipes can protrude from any four directions.

- Make holes in the pipe panel for the pipes to penetrate it and lay the pipes accordingly.
  - It is recommended to apply additional substance to the cut area for anti-rust protection.
- Ensure to install pipe panels to prevent rain water from getting into the unit.
- Close the gap at the pipe connected area with putty or heat insulator (locally supplied).
  - If an insect or small animal enters the outdoor unit, there is the risk of shorting in the product electronic casing. [Remove the front panel]
    - (1) Remove the 2 mounting screws.
    - (2) Slide the front panel using your hands downwards to release the pawls. Then remove by pulling the panel towards you.

**Precautions when operating the 3-way valve for piping installation**

- Do not open the 3-way valve until the piping installation is completed.
  - It is closed during shipment.
  - During installation the side panel may warp if only the flare nut is loosened and tightened with a torque wrench. As a result, always be sure to secure to the hexagonal part of the 3-way valve with a spanner, or other tool.
- Refer to the following table for the tightening torque of the 3-way valve flare nuts.
  - If the nuts are over tightened, they may cause the flares to break or leak.
- Do not add additional force to the valve's cover.
  - Using spanners on the cover or valve itself (other than the hexagonal parts) may cause gas leakage. Avoid using spanners on the cover or parts other than the hexagonal part of the valve.

- During the cooling mode operation under low ambient pressure, the low pressure side of the valve can be prone to freezing. Secure the flare nut (shared gas side / liquid side) section of the valve with a silicone sealing agent to prevent this from occurring.

[3-way valve operation method] • Use an Allen wrench (Size 4 mm or 6 mm).  
Direction to open

Opening : Open the cover and turn the Allen wrench counter-clockwise until it stops.  
Closing : Open the cover and turn the Allen wrench clockwise until it stops.

**Precautions for handling the valve cap**

- Ensure not to scratch the inner surface of the valve or the end of the valve shaft.
- Once adjustments to the valve are completed, ensure to tighten the valve cap according to the prescribed torque.

| Valve size | Tightening torque                      |
|------------|--|
| ø9.52      | 20.6N•m~28.4N•m<br>{2.1kgf•m~2.8kgf•m} |
| ø15.88     | 48.0N•m~59.8N•m<br>{4.8kgf•m~6.0kgf•m} |

**Precautions for handling the service ports**

- Use a push-rod with a charge hose.
- Once adjustments to the valve are completed, ensure to tighten the valve cap according to the prescribed torque.

| Tightening torque                      |
|--|
| 10.7N•m~14.7N•m<br>{1.1kgf•m~1.5kgf•m} |

**Precautions for connecting the pipes**

- Ensure that the pipes do not come into contact with the compressor's bolts or exterior panel.
- There is a risk of condensation from the 3-way valve coming out between the insulation material and the indoor unit's piping when you install the outdoor unit above then the indoor unit. Ensure to caulk the connection parts.

**Precautions for insulation installation**    **Maximum temperature limit of gas or liquid piping exceeds 120 °C**

- In high humidity environment, reinforce the insulation material for the refrigerant piping. Failure to do so may result in condensation on the surface of the insulation material.
- Use materials with good heat-resistant properties as the heat insulator for the pipes. Ensure to insulate both the gas side and liquid side pipes. If the pipes are not adequately insulated, condensation and water leakages may occur.
- Ensure that the current insulation covers the pipes up to the unit's connecting part. If the piping is exposed , it may cause condensation or burn (when touch the pipe).

## Precautions for flare nut installation

- Dimensions when adding flare nuts and the tightening torque (unit: mm)

| Piping size | Tightening torque                          | Flare section dimensions A | Flare configuration   |
|-------------|--|----------------------------|---|
| ø 6.35      | 14.2N·m ~ 17.2N·m<br>{1.4kgf·m ~ 1.7kgf·m} | 8.7 ~ 9.1                  |  |
| ø 9.52      | 32.7N·m ~ 39.9N·m<br>{3.3kgf·m ~ 4.0kgf·m} | 12.8 ~ 13.2                |   |
| ø 12.7      | 49.5N·m ~ 60.3N·m<br>{5.0kgf·m ~ 6.0kgf·m} | 16.2 ~ 16.6                |   |
| ø 15.88     | 68.0N·m ~ 75.5N·m<br>{6.8kgf·m ~ 7.6kgf·m} | 19.3 ~ 19.7                |   |

After piping connection has completed, ensure there is no gas leakage.

- When tightening the flare nut, coat the flares (inner surface only) with refrigerant oil on the flares

Firstly, screw in 3-4 turns by hand.

※ Ensure not to get oil on the screw part.

Refrigerant oil used is ether-based.

Application for ether-based oil

- Once the piping connections are completed, perform leakage inspection using nitrogen gas.

## VACUUM PURGING

- Once the piping connections are completed, perform leakage inspection using nitrogen gas (leak tightness test) using the 3-way valve for the outdoor unit and then close it.

Test the pressure :

3.8 MPa : Type PE1

4.15 MPa : Type PEY1

- Ensure to use a vacuum pump (with a back-flow prevention device) for inside the refrigerant system.
- Vacuuming process will take place after the leak test.

Use nitrogen gas for the leak tightness test.  
Using flammable gas can cause an explosion.

## REGARDING REFRIGERANT FILLING

### Precautions during refrigerant filling

- Ensure to fill only with liquid refrigerant when refilling. If gas refrigerant is filled, the refrigerant composition will not be balanced and will cause abnormal operation.
- If using cylinders as shown in the bottom left diagram; without a siphon tube inside, turn it upside down and use it. (It is recommended to use the manifold with the side glass.)

- Use tools that are designed specifically for R410A, for pressure resistance and to prevent mixing impurities.
- Fill the refrigerant from the 3-way valve's service port on the liquid-side.

For filling and replacing all refrigerant (For refilling due to a leak)

- For refilling refrigerant, first collect all residual refrigerant and after vacuum dehydration using the vacuum pump. Refill the refrigerant according to the prescribed amount stated on the placard affixed to this unit.

Precautions after the pipes' connection have completed

- Ensure to open the 3-way valve after completing the piping installation, leak test and vacuuming. If it is closed during operation, it can lead to compressor failure.

## Charging with refrigerant

### For Type PE1

- At the time of shipment from the factory, this unit is charged with enough refrigerant for an equivalent pipe length of 30m. If the equivalent pipe length used will be 30m or less, no additional charging will be necessary.
- If the equivalent pipe length will be between 30 and 50 / 75m, charge with additional refrigerant according to the equivalent length given in the table below.

|                  | Additional charging amount | Equivalent length | Minimum length |
|------------------|----------------------------|-------------------|----------------|
| U-71PE1          | 50g/m                      | 50m               | 5m             |
| U-100/125/140PE1 | 50g/m                      | 75m               | 5m             |

### For Type PEY1

- At the time of shipment from the factory, this unit is charged with enough refrigerant for an equivalent pipe length of 30m. If the equivalent pipe length used will be 30m or less, no additional charging will be necessary.
- If the equivalent pipe length will be between 30 and 50m, charge with additional refrigerant according to the equivalent length given in the table below.

|                   | Additional charging amount | Equivalent length | Minimum length |
|-------------------|----------------------------|-------------------|----------------|
| U-100/125/140PEY1 | 50g/m                      | 50m               | 5m             |

- Pump down operation
  - Operate the pump down according to the following procedures.

|   | Procedure   | Remarks  |
|---|---|--|
| 1 | Stop operation both outdoor and indoor units.   |  |
| 2 | Remove the cap and hood (bonnet) on the service port of the gas (wide tube) side from the outdoor unit. Then connect the pressure gauge (local supply) to the service port of the gas (wide tube) side.   | <ul style="list-style-type: none"> <li>• Be sure to use the pressure gauge (local supply) which is specific to low pressure measurable.</li> </ul>   |
| 3 | Short-circuit the pump down pin (PUMPDOWN) on the control PCB of the outdoor unit for 1 second or longer. Use a flathead screwdriver and short-circuit the pin.   | <ul style="list-style-type: none"> <li>• If the pump down pin (PUMPDOWN) on the control PCB of the outdoor unit is short circuit, refrigerant recovery control is started in the cooling operation.</li> <li>• The indoor fan is operated in High mode during pump down operation and the compressor drives in 60Hz.</li> </ul>  |
| 4 | When 2 or 3 minutes have passed after the start of outdoor unit operation, fully close the liquid (narrow tube) side valve of the outdoor unit.   | <ul style="list-style-type: none"> <li>• Refrigerant recovery will start.</li> <li>• The LED 1 on the control PCB of the outdoor unit blinks and LED 2 illuminates.</li> <li>• Maintenance function indication (  ) will blink on the LCD display of the wired remote controller (CZ-RTC2).</li> </ul>  |
| 5 | When the pressure gauge installed at the service port reaches the desired pressure of 0.2MPa - 0.1MPa, fully close the gas (wide tube) side valve of the outdoor unit. Then again short-circuit the pump down pin (PUMPDOWN) on the control PCB of the outdoor unit for 1 second or longer. | <ul style="list-style-type: none"> <li>• If the pump down operation has continued for over 10 minutes or the pump down pin (PUMPDOWN) on the control PCB of the outdoor unit is short circuit for 1 second or longer, the outdoor and indoor units will stop even though the pump down has not completed yet.</li> <li>• Do not operate the outdoor unit until the pressure value reaches negative pressure. Otherwise, this will cause the compressor trouble.</li> </ul> |
| 6 | Remove the pressure gauge installed at the gas (wide tube) side of the outdoor unit. Then reinstall the cap and hood (bonnet) in the original position once removed in the Step 2 described above.  | <ul style="list-style-type: none"> <li>• The pump down operation is completed.</li> </ul>  |

### NOTE

If you normally operate the refrigerant recovery unit, fully open both the liquid and gas valves of the outdoor unit.

**COMBINATION OF INDOOR UNIT CONNECTION**

**Twin, Triple and Double Twin Type Connections for Type PE1**

- Two, three or four indoor units can be operated simultaneously with a single remote controller. Note that individual operation is not possible.
- Master unit and slave unit can be set automatically in twin and triple system. No address setting is necessary.
- Applicable “TWIN” and “TRIPLE” combination table.

|             | Outdoor unit | Type 71 | Type 100 | Type 125 | Type 140 |
|-------------|--------------|---------|----------|----------|----------|
| TWIN        | combination  |         |          |          |          |
| TRIPLE      | combination  | —       |          |          |          |
| DOUBLE TWIN | combination  | —       | —        |          | —        |

**Twin Type Connections for Type PEY1**

- This unit cannot make triple or double twin connections.
- Two indoor units can be operated simultaneously with a single remote control unit. Note that individual operation is not possible.
- Master unit and slave unit can be set automatically in twin system. No address setting is necessary.
- Applicable “TWIN” combination table.

|      | Outdoor unit | Type 100 | Type 125 | Type 140 |
|------|--------------|----------|----------|----------|
| TWIN | combination  |          |          |          |

## Piping Connections

**For Type PE1**

- The following table shows the pipe diameter. (Branch pipe kit should be used) (unit: mm)

| Outdoor unit main pipe diameter (mm)                 | Branch pipe diameter | Indoor unit combination |             |             |              |              |
|--|----------------------|-------------------------|-------------|-------------|--------------|--------------|
|  |                      | S-36                    | S-45        | S-50        | S-60         | S-71         |
| Liquid side : $\phi 9.52$<br>Gas side : $\phi 15.88$ | Liquid side          | $\phi 6.35$             | $\phi 6.35$ | $\phi 6.35$ | $\phi 9.52$  | $\phi 9.52$  |
|  | Gas side             | $\phi 12.7$             | $\phi 12.7$ | $\phi 12.7$ | $\phi 15.88$ | $\phi 15.88$ |
| Branch pipe kit (option)                             | TWIN, DOUBLE TWIN    | CZ-P155BK1              |             |             |              |              |
|  | TRIPLE               | CZ-P3HPC2               |             |             |              |              |

- The following table shows the equivalent pipe lengths and height differences.

|   | SYMBOLS                             |   |   | SPEC                                   |
|---|-------------------------------------|---|---|--|
|   | TWIN                                | TRIPLE  | DOUBLE TWIN   |  |
| Total pipe length   | $L+La+Lb$                           | $L+La+Lb+Lc$  | $L+La+Lb+Lc+Ld+Le+Lf$   | U-60/71P : 50m<br>U-100/125/140P : 75m |
| Maximum branch pipe length                                    | $La$ or $Lb$                        | $La$ or $Lb$ or $Lc$                                  | $La+Lc$ or $La+Ld$ or $Lb+Le$ or $Lb+Lf$  | Less than 15m                          |
| Maximum branch pipe length difference                         | $La > Lb$<br>$La - Lb$              | $La > Lb > Lc$<br>$La - Lb$<br>$Lb - Lc$<br>$La - Lc$ | $Lb+Lf \rightarrow \text{MAX}$<br>$La+Lc \rightarrow \text{MIN}$<br>$(Lb + Lf) - (La + Lc)$ | Less than 10m                          |
| Maximum pipe length difference of branch pipe 1 (DOUBLE TWIN) | —                                   | —   | $Lb > La$<br>$Lb - La$  | Less than 10m                          |
| Maximum pipe length difference of branch pipe 2 (DOUBLE TWIN) | —                                   | —   | $Ld > Lc$<br>$Lf > Le$<br>$Ld - Lc$<br>$Lf - Le$  | Less than 10m                          |
| Height difference   | Outdoor located higher installation | H1  |   | Less than 30m                          |
|   | Outdoor located lower installation  | H1  |   | Less than 15m                          |
| Height difference between indoor units                        | H2                                  | H2 or H3 or H4  | H2 or H3 or H4 or H5 or H6 or H7  | Less than 0.5m                         |

**For Type PEY1**

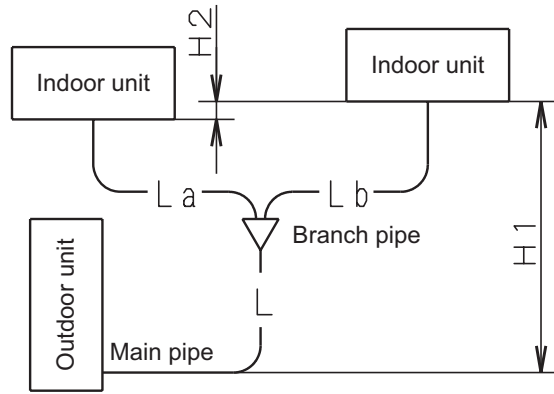

- The following table shows the pipe diameter. (Branch pipe kit should be used) (unit: mm)

| Outdoor unit main pipe diameter (mm)                 | Branch pipe diameter | Indoor unit combination |              |              |
|--|----------------------|-------------------------|--------------|--------------|
|  |                      | S-50                    | S-60         | S-71         |
| Liquid side : $\phi 9.52$<br>Gas side : $\phi 15.88$ | Liquid side          | $\phi 6.35$             | $\phi 9.52$  | $\phi 9.52$  |
|  | Gas side             | $\phi 12.7$             | $\phi 15.88$ | $\phi 15.88$ |
| Branch pipe kit (option)                             | TWIN                 | CZ-P155BK1              |              |              |

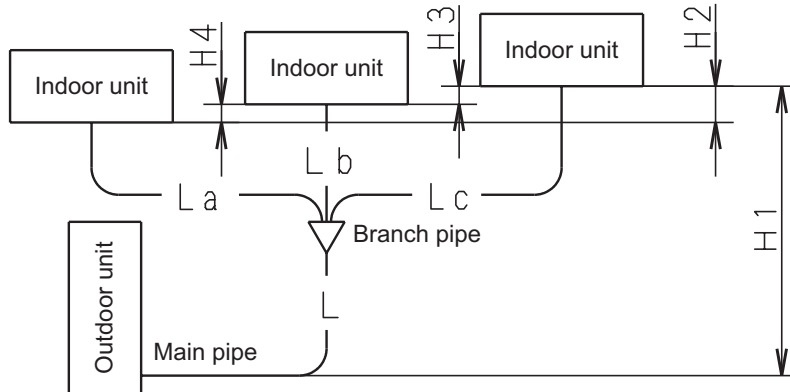

- The following table shows the equivalent pipe lengths and height differences.

|  | SYMBOLS                             |    | SPEC           |
|--|-------------------------------------|----|----------------|
|  | TWIN                                |    |                |

(TWIN type)

(TRIPLE type)

(DOUBLE TWIN type)

- Use the main pipe to gain any rise or fall required for the pipes.
- The number of bends should be 8 or less in a single system, and 15 or less overall.
- Branch pipes should be positioned horizontally.

Refrigerant charging

**For Type PE1**

- For the twin connection, the amount of refrigerant required for pipe length 30m has been included in this unit at the factory while that required for pipe length 20m has been included for the triple/double-twin connections. No additional charge is required for the first 30m pipe length in the case of the twin connection and for the first 20m in the case of the triple/double-twin connections. The amount of included refrigerant for each model is listed on NAME PLATE.

Make additional charges by adding up pipe length in an order of main pipe (L) → branch pipe (La → Lb → Lc wide diameter) and then selecting the amount of refrigerant corresponding to the remaining (after 30m for the twin connection and after 20m for the triple/double-twin connections) liquid side pipe diameter and pipe length from the below table.

(unit: mm)

| Liquid pipe diameter | Addition amount of refrigerant [g/m] |
|----------------------|--------------------------------------|
| ø6.35                | 20                                   |
| ø9.52                | 50                                   |

**For Type PEY1**

- For the twin connection, the amount of refrigerant required for pipe length 30m has been included in this unit at the factory. No additional charge is required for the first 30m pipe length in the case of the twin connection. The amount of included refrigerant for each model is listed on NAME PLATE.

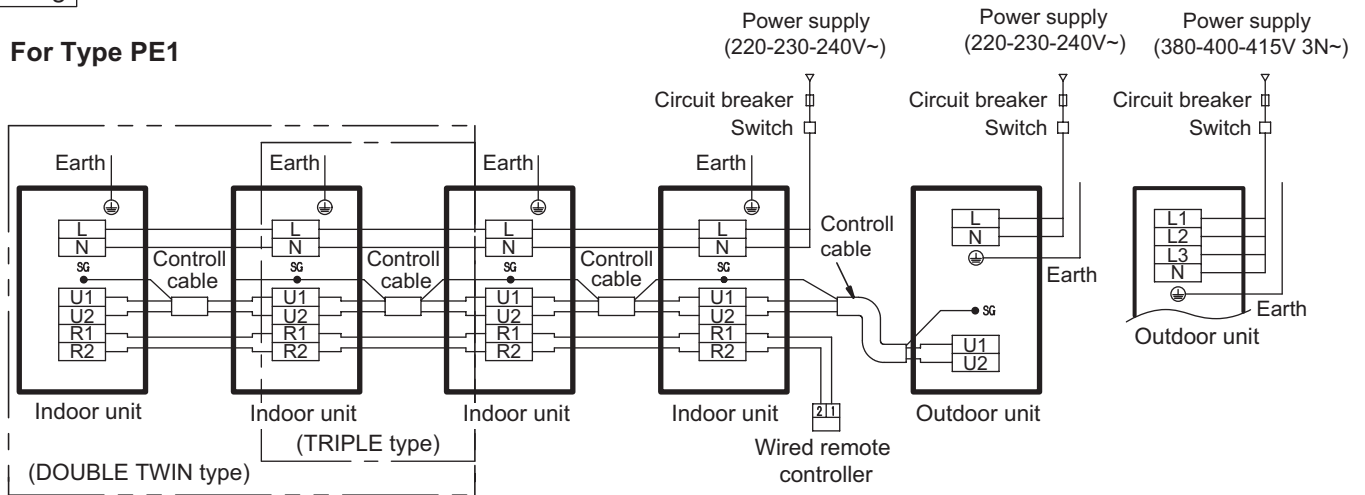

Make additional charges by adding up pipe length in an order of main pipe (L) → branch pipe (La → Lb wide diameter) and then selecting the amount of refrigerant corresponding to the remaining (after 30m for the twin connection) liquid side pipe diameter and pipe length from the below table.

(unit: mm)

| Liquid pipe diameter | Addition amount of refrigerant [g/m] |
|----------------------|--------------------------------------|
| ø6.35                | 20                                   |
| ø9.52                | 50                                   |

**For Type PEY1**

※ SG : Shows the earth for the shielded cable.

■ **Optional Distribution Joint Kits**

● CZ-P155BK1

- Prior to undertaking the installation work, read carefully through the “Installation Instructions” for the air conditioner and this “Installation Instructions”.
- This line branch pipe is used for the R410A refrigerant.

**1. Details of parts supplied**

Unit : mm (in.)

|  |                                   |                             |
|--|-----------------------------------|-----------------------------|
| 1 Liquid side branch pipe (inner diameter) |                                   |                             |
|  |                                   |                             |
| 2 Gas side branch pipe (inner diameter)    |                                   |                             |
|  |                                   |                             |
| 3 Thermal insulator (Gas side)             | 4 Thermal insulator (Liquid side) | 5 Installation Instructions |
| 1 pc                                       | 1 pc                              | 1 sheet                     |
|  |                                   |                             |

**2. Indoor/Outdoor unit piping installation**

- For details on the allowable amount of refrigerant, allowable pipe lengths and allowable elevation difference, refer to the Installation Instructions provided with the outdoor unit.
- The diameter of the piping for the indoor and outdoor units differs depending on the model of the unit. (Refer to respective diameter of the piping for the indoor and the outdoor units and install accordingly.) Use pipe cutters to cut the appropriate connecting section of the branch pipe to match the diameter of piping for the indoor and outdoor units.

**Pipe diameter for indoor unit**

| Cooling capacity of the indoor unit | Liquid side pipe diameter | Gas side pipe diameter |
|-------------------------------------|---------------------------|------------------------|
| < 6.0 kW                            | ø6.35                     | ø12.7                  |
| 6.0 kW ≤                            | ø9.52                     | ø15.88                 |

**Pipe diameter for outdoor unit**

| Cooling capacity of the outdoor unit | Liquid side pipe diameter | Gas side pipe diameter |
|--------------------------------------|---------------------------|------------------------|
| 7.1 kW - 15.5 kW                     | ø9.52                     | ø15.88                 |

2-1 Installation Instructions

- If the size of the selected refrigerant pipe and the size of the branch pipe differ, cut the connecting section with pipe cutters per the illustration at right. (Be sure to deburr and remove any impurities on the cutting surface.)

2-2 Installation precaution

Position the branch pipe on the appropriate horizontal and vertical plane so that branch flow is even.

2-3 Precautions at connecting points

After removing any impurities at the mouth of the pipe or the connecting points, be sure to clean the inside of the pipe with nitrogen gas (nitrogen displacement) to prevent oxide scale forming on the inner surface of the pipe. This step is extremely important when making the connections in the refrigerant piping. (Do not use an antioxidant)

3. Insulation directions

Gas side / Liquid side branch pipe insulation.

Note: Use insulating material that can tolerate 120°C on the gas side.

- 1) Insulate the gas side / liquid side of the branch pipe with thermal insulator.

- 2) Wrap tape all around the areas where the insulating materials are joined in order to seal it.

- 3) Wrap a wide PVC tape all around the surfaces where the ends of the branch pipe and insulating materials are abutted so as to close any gaps.

Note: Do not use any adhesive agents on the connections between thermal insulator.

**CZ-P3HPC2 (for simultaneous Triple)**

Liquid distribution joint for liquid tube

Gas distribution joint for gas tube

Liquid-tube side tube connector

Gas-tube side tube connector

Gas-tube side tube connector

Thermal insulation for liquid distribution joints

Thermal insulation for gas distribution joints

**■ Installing Distribution Joint Kit (for Triple) (CZ-P3HPC2)**

- Check the system combination before installing the distribution joints.
- Three indoor units must be installed within the same room.
- Use the supplied tube connectors to adjust the tube sizes of the distribution joints.

**How to Install Distribution Joints**

Use the supplied distribution joints to complete refrigerant tubing work. Install distribution joints so that the tubes are horizontal after the branch point.

**Orientation of distribution joints**

**Length requirement for strainer on main distribution tube side**

Attach a straight tube 500 mm or longer to the main tubing side of the distribution joint (for both liquid and gas tubing).

**Tubing insulation**

Be sure to apply thermal insulation to both the liquid and gas tubing. Depending on the conditions inside the ceiling, condensation may form on the insulation material. If high temperatures and high humidity are expected to occur inside the ceiling, add glass wool (16-20 kg/m<sup>3</sup>, with a thickness of 10 mm or more) to the below insulation materials and apply sufficient thermal insulation.

- Distribution joint insulation material (supplied)
- Use the supplied insulation material.
  - The supplied insulation material include only a tape for temporarily fastening.
  - Use insulation material or other material to seal the joining lines so that there are no gaps.
  - Use vinyl tape or similar means to seal and fasten the insulation materials in place.

### 3. 4-Way Cassette Type (U2)

#### ■ SELECTING THE INSTALLATION SITE

##### Indoor Unit

##### AVOID:

- areas where leakage of flammable gas may be expected.
- places where large amounts of oil mist exist.
- direct sunlight.
- locations near heat sources which may affect the performance of the unit.
- locations where external air may enter the room directly. This may cause “condensation” on the air discharge ports, causing them to spray or drip water.
- locations where the remote controller will be splashed with water or affected by dampness or humidity.
- installing the remote controller behind curtains or furniture.
- locations where high-frequency emissions are generated.

##### DO:

- select an appropriate position from which every corner of the room can be uniformly cooled.
- select a location where the ceiling is strong enough to support the weight of the unit.
- select a location where tubing and drain pipe have the shortest run to the outdoor unit.
- allow room for operation and maintenance as well as unrestricted air flow around the unit.
- the limitation of the tubing length between the indoor and the outdoor units should be referred to the Installation Instructions of the outdoor unit.
- allow room for mounting the remote controller about 1 m off the floor, in an area that is not in direct sunlight or in the flow of cool air from the indoor unit.

##### 4-Way Cassette Type

■ HOW TO INSTALL THE INDOOR UNIT

■ 4-Way Cassette Type (Type U2)

Preparation for Suspending

This unit uses a drain pump. Use a carpenter's level to check that the unit is level.

Suspending the Indoor Unit

(1) Fix the suspension bolts securely in the ceiling using the method shown in the diagrams, by attaching them to the ceiling support structure, or by any other method that ensures that the unit will be securely and safely suspended.

Note: For DC Fan Tap Change Procedure for 4-Way Cassette, see page 1-11-3-13.

(2) Follow the diagram to make the holes in the ceiling.

(3) Determine the pitch of the suspension bolts using the supplied full-scale installation diagram (printed on container box). The diagram shows the relationship between the positions of the suspension fitting, unit, and panel. Use the nut (field supply) and washer (supplied) for upper and lower position of the suspension lug.

\* The overlapping portion between the ceiling and panel for cassette should be kept over 20 mm.

## Placing the Unit Inside the Ceiling

This unit is equipped with the drain pump. Check a tape measure or carpenter's level.

Before installing the panel for cassette, complete the work of drain pipe and refrigerant pipe installation.

- (1) When placing the unit inside the ceiling, determine the pitch of the suspension bolts using the supplied full-scale installation diagram.

Tubing and wiring must be laid inside the ceiling when suspending the unit. If the ceiling is already constructed, lay the tubing and wiring into position for connection to the unit before placing the unit inside the ceiling.

- (2) The length of suspension bolts must be appropriate for a distance between the bottom of the bolt and the bottom of the unit of more than 18 mm.

Full-scale installation diagram  
(printed on top of container box)

- (3) Thread the 3 hexagonal nuts and 2 washers onto each of the 4 suspension bolts. Use 1 nut and 1 washer for the upper side, and 2 nuts and 1 washer for the lower side, so that the unit will not fall off the suspension lugs.

- (4) Adjust so that the distance between the unit and the ceiling bottom is 12 to 17 mm. Tighten the nuts on the upper side and lower side of the suspension lug.
- (5) Remove the protective polyethylene used to protect the fan parts during transport.
- (6) Check with a tape measure or carpenter's level.

## Installing the Drain Pipe

### Before Performing the Installation Drain Piping

#### (1) Limitations of Raising the Drain Pipe Connection

#### CAUTION

- The drain pipe can be raised to a maximum height of 850 mm from the bottom of the ceiling. Do not attempt to raise it higher than 850 mm. Doing so will result in water leakage.

Bottom of the Ceiling board

\* Length of supplied drain pipe = 250 mm

#### (2) Limitations of Drain Pipe Connection

#### CAUTION

- Do not install the drain pipe with an upward gradient from the drain port connection. This will cause the drain water to flow backward and leak when the unit is not operating.
- Do not install an air bleeder as this may cause water to spray from the drain pipe outlet.
- Do not provide U-trap or bell-shaped trap in the middle of the drain pipe. Doing so will cause abnormal sound.

- Make sure the drain pipe has a downward gradient (1/100 or more; downward from drain port connection).

#### (3) Limitations of Drain Hose Connection

#### CAUTION

- Do not bend the supplied drain hose 90° or more. Bend it less than 45°.

- Do not make a trap in the middle of the supplied drain hose. Doing so will cause abnormal sound.

## Installing the Drain Pipe

### CAUTION

- Do not apply force to the drain port when connecting the drain pipe. Install and fix it near the indoor unit as close as possible.
- Do not use adhesive when connecting the drain port pipe and the drain hose.

#### (1) How to Install the Drain Pipe

- 1) First insert the supplied hose band into the drain port pipe. Then make sure the head of the screw is facing toward a technical engineer when placing the screw of the hose band at an upward angle.
- 2) Insert the soft PVC socket of the supplied drain hose to the drain port pipe. Do not use adhesive when connecting the drain hose to the drain port pipe. Insert it until the tip of the drain hose contacts the uneven surface of the drain port pipe.

- 3) Move the hose band so that the center position of the hose band can be placed approx. 30 mm away from the external plate of the indoor unit. See diagram below.
- 4) Screw the drain hose tightly facing the screw of the hose band upward. (Torque: 2.5 N·m - 3.4 N·m) (If the screw is tightened beneath the drain hose, the troubles will be generated.)
- 5) Apply approx. 2 g of adhesive on both sides of the drain hose without connection of the hard PVC socket and the hard PVC pipe joint (VP25) in the local supply.
- 6) Connect the drain hose and the hard PVC pipe joint so that the adhesive area of both sides can be overlapped. Wipe off the protrusion-adhesive with a soft cloth.

**Checking the Drainage**

**CAUTION** Be careful since the fan will start when you short the pin on the indoor control board.

After wiring (refer to 1-10. Electrical Wiring.) and drain piping are completed, use the following procedure to check that the water will drain smoothly. For this, prepare a bucket and wiping cloth to catch and wipe up spilled water.

- (1) Connect power to the power terminal board (L, N terminals) inside the electrical component box.
- (2) Slowly pour about 1 L of water into the drain pan to check drainage.

- (3) Short the check pin (CHK) (6P : 5-6) on the indoor control board and operate the drain pump. Check the water flow through the transparent drain pipe and see if there is any leakage.
  - \* If the check pin (CHK) (6P:5-6) is shorted, the fan starts rotating at high speed and could cause injury.
- (4) When the check of drainage is complete, open the check pin (CHK) (6P : 5-6) and remount the tube cover.
- (5) Checkpoint after installation  
After installation of indoor and outdoor units, panels and electrical wiring, check the following items.

**Important Note for Wiring 4-Way Cassette Type**

Power supply inlet

- (1) The power supply inlet is located at the lower area of the refrigerant tubing side of the unit. The electrical component box is located at the air intake of the bottom of the unit.
- (2) Before installing the panel for cassette, be sure to carry out the wiring connection.
- (3) Remove the lid located on the bottom of the indoor unit attaching the electrical component box by unscrewing the Phillips head tapping screws (x2).

- (4) Lead the wires from the power supply inlet to the unit. Be sure to lead the wires through the power supply inlet. Make sure that no wire is caught between the indoor unit and panel for cassette. Otherwise, the unit may cause a fire.
- (5) Connect the wires into the terminals through the power supply inlet for the electrical component box. Fix the wires with a clamping clip.
- (6) Reinstall the lid of the electrical component box in its original position with paying attention not to have the wires caught in the lid. Refer to "1-10. Electrical Wiring".

## ■ HOW TO PROCESS TUBING

### Connecting the Refrigerant Tubing

#### Use of the Flaring Method

Many of conventional split system air conditioners employ the flaring method to connect refrigerant tubes that run between indoor and outdoor units. In this method, the copper tubes are flared at each end and connected with flare nuts.

#### Flaring Procedure with a Flare Tool

- (1) Cut the copper tube to the required length with a tube cutter. It is recommended to cut approx. 30 – 50 cm longer than the tubing length you estimate.
- (2) Remove burrs at each end of the copper tubing with a tube reamer or a similar tool. This process is important and should be done carefully to make a good flare. Be sure to keep any contaminants (moisture, dirt, metal filings, etc.) from entering the tubing.

#### Deburring

#### NOTE

When reaming, hold the tube end downward and be sure that no copper scraps fall into the tube.

- (3) Remove the flare nut from the unit and be sure to mount it on the copper tube.
- (4) Make a flare at the end of the copper tube with a flare tool.

#### NOTE

A good flare should have the following characteristics:

- inside surface is glossy and smooth
- edge is smooth
- tapered sides are of uniform length

#### Caution Before Connecting Tubes Tightly

- (1) Apply a sealing cap or water-proof tape to prevent dust or water from entering the tubes before they are used.
- (2) Be sure to apply refrigerant lubricant (ether oil) to the inside of the flare nut before making piping connections. This is effective for reducing gas leaks.

- (3) For proper connection, align the union tube and flare tube straight with each other, then screw on the flare nut lightly at first to obtain a smooth match.

- Adjust the shape of the liquid tube using a tube bender at the installation site and connect it to the liquid tubing side valve using a flare.

### Connecting Tubing Between Indoor and Outdoor Units

- (1) Tightly connect the indoor-side refrigerant tubing extended from the wall with the outdoor-side tubing.

#### Indoor Unit Tubing Connection ( $\varnothing_1, \varnothing_2 \dots \varnothing_{n-1}$ )

| Indoor unit type   | 36                 | 45 | 50 | 60                  | 71 | 100 | 125 | 140 |
|--------------------|--------------------|----|----|---------------------|----|-----|-----|-----|
| Gas tubing (mm)    | $\varnothing 12.7$ |    |    | $\varnothing 15.88$ |    |     |     |     |
| Liquid tubing (mm) | $\varnothing 6.35$ |    |    | $\varnothing 9.52$  |    |     |     |     |

- (2) To fasten the flare nuts, apply specified torque.
- When removing the flare nuts from the tubing connections, or when tightening them after connecting the tubing, be sure to use a torque wrench and a spanner. If the flare nuts are over-tightened, the flare may be damaged, which could result in refrigerant leakage and cause injury or asphyxiation to room occupants.

- For the flare nuts at tubing connections, be sure to use the flare nuts that were supplied with the unit, or else flare nuts for R410A (type 2). The refrigerant tubing that is used must be of the correct wall thickness as shown in the table below.

| Tube diameter | Tightening torque (approximate)       | Tube thickness |
|---------------|---------------------------------------|----------------|
| ø6.35 (1/4")  | 14 – 18 N · m<br>{140 – 180 kgf · cm} | 0.8 mm         |
| ø9.52 (3/8")  | 34 – 42 N · m<br>{340 – 420 kgf · cm} | 0.8 mm         |
| ø12.7 (1/2")  | 49 – 61 N · m<br>{490 – 610 kgf · cm} | 0.8 mm         |
| ø15.88 (5/8") | 68 – 82 N · m<br>{680 – 820 kgf · cm} | 1.0 mm         |

Because the pressure is approximately 1.6 times higher than conventional refrigerant (R22) pressure, the use of ordinary flare nuts (type 1) or thin-walled tubes may result in tube rupture, injury, or asphyxiation caused by refrigerant leakage.

- In order to prevent damage to the flare caused by over-tightening of the flare nuts, use the table above as a guide when tightening.
- When tightening the flare nut on the liquid tube, use an adjustable wrench with a nominal handle length of 200 mm.

### Insulating the Refrigerant Tubing

#### Tubing Insulation

- Thermal insulation must be applied to all units tubing, including distribution joint (field supply).
  - \* For gas tubing, the insulation material must be heat resistant to 120°C or above. For other tubing, it must be heat resistant to 80°C or above.

Insulation material thickness must be 10 mm or greater. If the conditions inside the ceiling exceed DB 30°C and RH 70%, increase the thickness of the gas tubing insulation material by 1 step.

#### Two tubes arranged together

**If the exterior of the outdoor unit valves has been finished with a square duct covering, make sure you allow sufficient space to access the valves and to allow the panels to be attached and removed.**

#### Taping the flare nuts

Wind the white insulating tape around the flare nuts at the gas tube connections. Then cover up the tubing connections with the flare insulator, and fill the gap at the union with the supplied black insulating tape. Finally, fasten the insulator at both ends with the supplied vinyl clamps.

#### Insulation material

The material used for insulation must have good insulation characteristics, be easy to use, be age resistant, and must not easily absorb moisture.

#### CAUTION

**After a tube has been insulated, never try to bend it into a narrow curve because it can cause the tube to break or crack.**

**Never grasp the drain or refrigerant connecting outlets when moving the unit.**

#### Taping the Tubes

- (1) At this time, the refrigerant tubes (and electrical wiring if local codes permit) should be taped together with armoring tape in 1 bundle. To prevent condensation from overflowing the drain pan, keep the drain hose separate from the refrigerant tubing.
- (2) Wrap the armoring tape from the bottom of the outdoor unit to the top of the tubing where it enters the wall. As you wrap the tubing, overlap half of each previous tape turn.
- (3) Clamp the tubing bundle to the wall, using 1 clamp approx. each meter.

#### NOTE

Do not wind the armoring tape too tightly since this will decrease the heat insulation effect. Also ensure that the condensation drain hose splits away from the bundle and drips clear of the unit and the tubing.

## Finishing the Installation

After finishing insulating and taping over the tubing, use sealing putty to seal off the hole in the wall to prevent rain and draft from entering.

## ■ HOW TO INSTALL THE TIMER REMOTE CONTROLLER OR HIGH-SPEC WIRED REMOTE CONTROLLER (OPTIONAL PART)

### NOTE

Refer to the Operating Instructions attached to the optional Timer Remote Controller or optional High-spec Wired Remote Controller.

■ HOW TO INSTALL THE CEILING PANEL

■ 4-Way Cassette Type (Type U2)

CZ-KPU3

Accessories

**Preparation for Panel for Cassette Installation**

(1) Checking the unit position

- 1) Check that the ceiling hole is within this range:  
860 mm x 860 mm to 910 mm x 910 mm
- 2) Confirm that the position of the indoor unit and the ceiling as shown in the diagram. If the positions of the ceiling surface and unit do not match, air leakage, water leakage, flap operation failure, or other problems may occur.

Ⓐ : Be sure to necessarily make a space within the range of 12 mm ~ 17 mm.

If not within this range, malfunction or other trouble may occur.

**CAUTION**

- Never place the panel face-down. Either hang it vertically or place it on top of a projecting object. Placing it face-down will damage the surface.
- Do not touch the flap or apply force to it. (This may cause flap malfunction.)

**How to Install the Panel for Cassette**

(1) Removing the air-intake grille

- 1) Remove the 2 screws on the latch of the air-intake grille. (Reattach the air-intake grille after installation of the panel for cassette.)
- 2) Slide the air-intake grille catches in the direction shown by the arrows ① to open the grille.

- 3) With the air-intake grille opened, remove the grille hinge from the panel for cassette by sliding it in the direction shown by the arrow ②. (Reattach the air-intake grille after installation of the panel for cassette.)

(2) Removing the corner cover

Push the latches on the corner cover in the direction of the arrow ① and remove them by sliding in the direction of the arrow ②.

(3) Installing the panel for cassette

The power must be turned ON in order to change the flap angle. (Do not attempt to move the flap by hand. Doing so may damage the flap.)

- 1) Hang the temporary latches on the inside of the panel for cassette to the receptacle on the unit to temporarily attach the panel for cassette in place.
  - The panel for cassette must be installed in the correct direction relative to the unit. Align the REF. PIPE and DRAIN marks on the panel for cassette corner with the correct positions on the unit.
  - When removing the panel for cassette, push the temporary latches outward while holding the panel for cassette.

- 2) Align the panel installation holes and the unit screw holes.
- 3) Tighten the provided washer head screws at the 4 panel installation locations so that the panel is attached tightly to the unit.

- 4) Check that the panel is attached tightly to the ceiling.
  - At this time, make sure that there are no gaps between the unit and the panel for cassette, or between the panel for cassette and the ceiling surface.

- If there is a gap between the panel and the ceiling, leave the panel for cassette attached and make fine adjustments to the installation height of the unit to eliminate the gap with the ceiling.

**CAUTION**

- If the screws are not sufficiently tightened, trouble such as that shown in the figure below may occur. Be sure to tighten the screws securely.

- If a gap remains between the ceiling surface and the panel for cassette even after the screws are tightened, adjust the height of the unit again.

(4) Wiring the Panel for Cassette

- 1) Open the cover of the electrical component box for control PCB.
  - 2) Connect the 22P connector (white) from the panel for cassette to the connector on the control PCB in the unit electrical component box. In this case, expose the cutout section of the tube for the wiring protection to the outside from the electrical component box and fix it with the clamber attached to the electrical component box.
- If the connectors are not connected, the Auto Flap will not operate. Be sure to connect them securely. (If not connected completely, "P09" will be displayed on the remote controller.)
  - Check that the wiring connector is not caught between the electrical component box and the cover.
  - Check that the wiring connector is not caught between the unit and the panel for cassette.

B. Attaching the air-intake grille

- To install the air-intake grille, follow the steps for "Removing the grille" in the reverse order. By rotating the air-intake grille, it is possible to attach the grille onto the panel for cassette from any of 4 directions. Coordinate the directions of the air-intake grilles when installing multiple units, and change the directions according to customer's requests.
- When attaching the air-intake grille, be careful that the flap lead wire does not become caught.
- Be sure to attach the safety cord that prevents the air-intake grille from dropping off to the panel for cassette unit as shown in the figure below.
- With this panel for cassette, the directions of the air-intake grille lattices when installing multiple units, and the position of the label showing the company name on the corner panel, can be changed according to customer's requests, as shown in the figure below. However, the wireless signal receiver can only be installed at the refrigerant-tubing corner of the ceiling unit.

(5) How to Attach the Corner & Air-Intake Grille

A. Attaching the corner cover

- 1) Check that the safety cord from the corner cover is fastened to the panel for cassette pin, as shown in the figure below.
- 2) Use the supplied screws to attach the corner cover to the panel for cassette.

■ Others

(1) Checking After Installation

- 1) Check that there are no gaps between the unit and the panel for cassette, or between the panel for cassette and the ceiling surface.

\* Gaps may cause water leakage and condensation.

- 2) Check that the wiring is securely connected.

\* If it is not securely connected, the auto flap will not operate.

("P09" is displayed on the remote controller.)

In addition, the water leakage and condensation may occur.

(2) Operating the Wireless Remote Controller

For details of installation, refer to the section "Wireless Signal Receiver" in the supplied installation instructions.

(3) Selecting DC Fan Motor Tap (4-Way Cassette)

Check the optional parts accordingly in the following table.

**Table for DC Fan Motor Tap Settings**

| Setting No. | Remote controller setting data<br>Item code 5d | Contents & optional parts name                    |
|-------------|--|---|
| (1)         | 0001   | Air-flow blocking kit (for 3-way air flow)*2      |
|             |  | Air-flow blocking kit (when a duct is connected.) |
|             |  | High-ceiling setting 1*2                          |
| (3)         | 0003   | High-ceiling setting 2*2                          |
| (6)         | 0006   | Air-flow blocking kit (for 2-way air flow)*2      |

\*1 When using optional parts in different setting No. in combination with multiple units, conform it to the larger setting No.

\*2 Ceiling height (m)

| Indoor unit type                           | 36,45,50 | 60,71 | 100,125,140 |
|--|----------|-------|-------------|
| Standard (factory setting)                 | 2.7      | 3.0   | 3.6         |
| High-ceiling setting 1                     | 3.2      | 3.3   | 4.3         |
| High-ceiling setting 2                     | 3.5      | 3.6   | 5.0         |
| Air-flow blocking kit (for 3-way air flow) | 3.8      | 3.8   | 4.7         |
| Air-flow blocking kit (for 2-way air flow) | 4.2      | 4.2   | 5.0         |

- 1) When setting on the P.C. Board

<Procedure>

**Stop the system before performing these steps.**

- ① Open the electrical component box cover, then check the indoor unit control PCB.
- ② Change the DIP switch on the indoor unit control PCB in accordance with the setting number which was confirmed in Table for DC Fan Motor Tap Settings.

| Setting No. | DIP switch | Setting No. | DIP switch |
|-------------|------------|-------------|------------|
| (1)         |            | (6)         |            |
| (3)         |            |             |            |

**<Procedure of CZ-RTC5A>**

**Stop the system before performing these steps.**

- ① Keep pressing the , and buttons simultaneously for 4 or more seconds. The "Maintenance func" screen appears on the LCD display.

- ② Press the or button to see each menu. If you wish to see the next screen instantly, press the or button. Select "8. Detailed settings" on the LCD display and press the button.

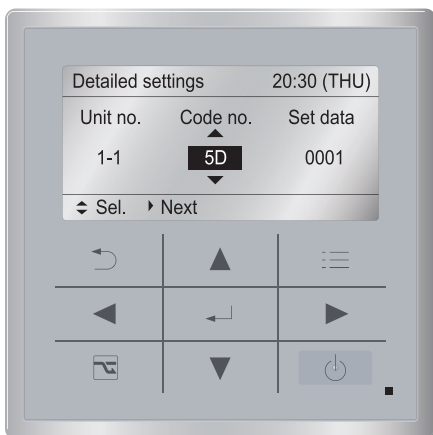

The "Detailed settings" screen appears on the LCD display.

- ③ Select the "Unit no." by pressing the or button for changes.

- ④ Select the "Code no." by pressing the or button.

Change the "Code no." to "5D" by pressing the or button (or keeping it pressed).

- ⑤ Select the "Set data" by pressing the or button.

Select one of the "Set data" in "Table for DC Fan Motor Tap Settings" by pressing the or button.

Then press the button.

- ⑥ Press the button. The "Exit detailed settings and restart?" (Detailed setting-end) screen appears on the LCD display. Select "YES" and press the button.

If you wish to change the selected indoor unit, follow the step ②.

<Procedure of CZ-RTC4>

Stop the system before performing these steps.

- ① Press and hold the , , and buttons simultaneously for 4 seconds or longer.
- ② If group control is in effect, press the button to set. At this time, the fan at the indoor unit begins and select the address (unit No.) of the indoor unit operating.
- ③ Designate the item code **5d** by adjusting the Temperature Setting / buttons.
- ④ Press the timer time buttons to select the desired setting data.  
\*For item codes and setting data, refer to "Table for DC Fan Motor Tap Settings".
- ⑤ Press the button. (The display stops blinking and remains lit, and setting is completed.)  
If you wish to change the selected indoor unit, follow the step ②.
- ⑥ Press the button to return to normal remote controller display.

(4) Setting the Flap Separately

- 1) The 4-air outlet flap can be adjusted separately during operation. When not adjusted separately, all flaps operate in the same manner.

<Procedure of CZ-RTC5A>

Stop the system before performing these steps.

- (1) Keep pressing the and buttons simultaneously for 4 or more seconds.  
The "Maintenance func" screen appears on the LCD display.

- (2) Press the or button to see each menu. If you wish to see the next screen instantly, press the or button. Select "8. Detailed settings" on the LCD display and press the button.

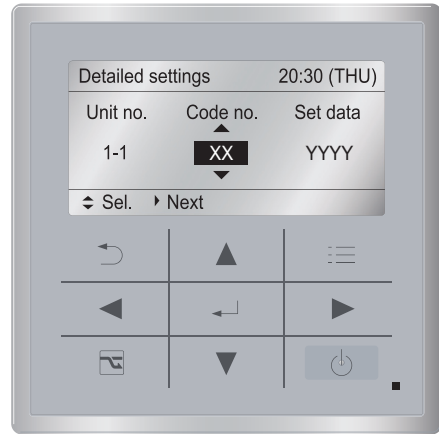

The "Detailed settings" screen appears on the LCD display.

- (3) Select the "Unit no." by pressing the or button for changes.

- (4) Select the "Code no." by pressing the or button. Change the "Code no." to "XX" by pressing the or button (or keeping it pressed).

- (5) Select the "Set data" by pressing the or button. Select one of the Setting Data "YYYY" by pressing the or button. Then press the button.

Flap position

\* Setting data "YYYY"

| Setting data | Flap position during operation |
|--------------|--------------------------------|
| 0000         | Without separate setting       |
| 0001         | Swing                          |
| 0002         | Move to position 1 and stay    |
| 0003         | Move to position 2 and stay    |
| 0004         | Move to position 3 and stay    |
| 0005         | Move to position 4 and stay    |
| 0006         | Move to position 5 and stay    |

**NOTE**

The flap swings during the operation under "Setting the Flap Separately".  
At this time, the unselected flaps are moved to the position 1.

- (6) Press the button. The "Exit detailed settings and restart?" (Detailed setting-end) screen appears on the LCD display. Select "YES" and press the button.

If you wish to change the selected indoor unit, follow the step (2).

**<Procedure of CZ-RTC4>**

**Stop the system before performing these steps.**

- (1) Press and hold the , and buttons simultaneously for 4 seconds or longer.
- (2) If group control is in effect, press the button to set. At this time, the fan at the indoor unit begins and select the address (unit No.) of the indoor unit operating.
- (3) Designate the item code "XX" by adjusting the Temperature Setting / buttons.

- (5) Press the button.  
(The display stops blinking and remains lit, and setting is completed.)  
If you wish to change the selected indoor unit, follow the step (2).
- (6) Press the button to return to normal remote controller display.

- (4) Press the timer time / buttons to select the desired setting data.

\* Setting data "YYYY"

| Setting data | Flap position during operation |
|--------------|--------------------------------|
| 0000         | Without separate setting       |
| 0001         | Swing                          |
| 0002         | Move to position 1 and stay    |
| 0003         | Move to position 2 and stay    |
| 0004         | Move to position 3 and stay    |
| 0005         | Move to position 4 and stay    |
| 0006         | Move to position 5 and stay    |

**NOTE**

The flap swings during the operation under "Setting the Flap Separately".  
At this time, the unselected flaps are moved to the position 1.

## Accessories Supplied with Unit

### (4-Way Cassette)

| Part Name                       | Figure  | Q'ty | Remarks                             |
|---------------------------------|---|------|-------------------------------------|
| Full-scale installation diagram |    | 1    | Printed on container box            |
| Washer                          |    | 8    | For suspension bolts                |
| Screw                           |    | 4    | For full-scale installation diagram |
| Insulating tape                 |    | 2    | For gas and liquid tube flare nuts  |
| Flare insulator                 |    | 1    | For liquid tube                     |
| Flare insulator                 |    | 1    | For gas tube                        |
| Drain hose                      |    | 1    |                                     |
| Hose band                       |    | 1    | For securing drain hose             |
| Packing                         |   | 1    |                                     |
| Drain insulator                 |  | 1    |                                     |
| Clamper                         |  | 4    | For electrical wiring               |
| Operating Instructions          |  | 1    |                                     |
| Installation Instructions       |  | 1    |                                     |

- Use M10 for suspension bolts.
- Field supply for suspension bolts and nuts.

## Type of Copper Tube and Insulation Material

If you wish to purchase these materials separately from a local source, you will need:

1. Deoxidized annealed copper tube for refrigerant tubing.
2. Foamed polyethylene insulation for copper tubes as required to precise length of tubing. Wall thickness of the insulation should be not less than 8 mm.
3. Use insulated copper wire for field wiring. Wire size varies with the total length of wiring. Refer to Electrical Wiring for details on page 1-10-7.

### CAUTION

**Check local electrical codes and regulations before obtaining wire. Also, check any specified instructions or limitations.**

### Additional Materials Required for Installation

1. Refrigeration (armored) tape
2. Insulated staples or clamps for connecting wire (See your local codes.)
3. Putty
4. Refrigeration tubing lubricant
5. Clamps or saddles to secure refrigerant tubing
6. Scale for weighing

**■ Panel for Cassette (ECONAVI type)**

**CZ-KPU3A**

**Applicable indoor unit : 4-Way Cassette**

**Accessories Supplied**

| Part Name                 | Figure  | Q'ty | Remarks      |
|---------------------------|---|------|--------------|
| ECONAVI panel             |  | 1    | ECONAVI type |
| Screw                     |  | 4    | 4 × 12       |
| Operating Instructions    |  | 1    |              |
| Installation Instructions |  | 1    |              |

Since the accessories need for installation work, do not dispose of them until the unit of work is complete.

**■ CAUTION ON INSTALLATION**

**Criteria for Human Detection Area**

- A place where the blind angle of the Human Detection Sensor cannot detect human.  
Install the panel for cassette (ECONAVI type) so that human motion can be detected.
- If there is a heat source or cooling unit in the detection area, the sensor cannot occasionally detect properly.
- The Floor Temperature Sensor detects within the sensor area of Human Detection Sensor.

Criteria of human detection sensor area  
 Installation height of indoor unit 2.7 m : Approx. ø7 m  
 Installation height of indoor unit 4 m : Approx. ø8 m  
 Installation height of indoor unit 5 m : Approx. ø9 m

Do not install at the following locations. (Cause of trouble and malfunction)

- Humid, oily, frequent vibration
- Direct sunlight and near by heat source
- Frost

## Preparation for Panel for Cassette Installation

### (1) Checking the unit position

- 1) Check that the ceiling hole is within this range:  
860 × 860 mm to 910 × 910 mm
- 2) Confirm that the position of the indoor unit and the ceiling as shown in the diagram. If the positions of the ceiling surface and unit do not match, air leakage, water leakage, flap operation failure, or other problems may occur.

Ⓐ : Be sure to necessarily make a space within the range of 12 ~ 17 mm.

If not within this range, malfunction or other trouble may occur.

### CAUTION

- Never place the panel face-down. Either hang it vertically or place it on top of a projecting object. Placing it face-down will damage the surface.
- Do not touch the flap or apply force to it. (This may cause flap malfunction.)

## How to Install the Panel for Cassette

### (1) Removing the air-intake grille

- 1) Remove the 2 screws on the latch of the air-intake grille. (Reattach the air-intake grille after installation of the panel for cassette.)
- 2) Slide the air-intake grille catches in the direction shown by the arrows ① to open the grille.

- 3) With the air-intake grille opened, remove the grille hinge from the panel for cassette by sliding it in the direction shown by the arrow ②. (Reattach the air-intake grille after installation of the panel for cassette.)

### (2) Removing the corner cover

Push the latches on the corner cover in the direction of the arrow ① and remove them by sliding in the direction of the arrow ②.

(3) Installing the panel for cassette

The power must be turned ON in order to change the flap angle. (Do not attempt to move the flap by hand. Doing so may damage the flap.)

1) Hang the temporary latches on the inside of the panel for cassette to the receptacle on the unit to temporarily attach the panel for cassette in place.

- The panel for cassette must be installed in the correct direction relative to the unit. Align the REF. PIPE and DRAIN marks on the panel for cassette corner with the correct positions on the unit.
- When removing the panel for cassette, push the temporary latches outward while holding the panel for cassette.

- 2) Align the panel installation holes and the unit screw holes.
- 3) Tighten the provided washer head screws at the 4 panel installation locations so that the panel is attached tightly to the unit.

- 4) Check that the panel is attached tightly to the ceiling.
- At this time, make sure that there are no gaps between the unit and the panel for cassette, or between the panel for cassette and the ceiling surface.

- If there is a gap between the panel and the ceiling, leave the panel for cassette attached and make fine adjustments to the installation height of the unit to eliminate the gap with the ceiling.

**CAUTION**

- If the screws are not sufficiently tightened, trouble such as that shown in the figure below may occur. Be sure to tighten the screws securely.

- If a gap remains between the ceiling surface and the panel for cassette even after the screws are tightened, adjust the height of the unit again.

#### (4) Wiring the Panel for Cassette

- 1) Open the cover of the electrical component box for control PCB.
  - 2) Connect the 22P connector (white) and 6P connector (white) from the panel for cassette to the connector on the control PCB in the unit electrical component box. In this case, expose the cutout section of the tube for the wiring protection to the outside from the electrical component box and fix it with the clasper attached to the electrical component box.
- **If the connectors are not connected, the Auto Flap will not operate. Be sure to connect them securely. (If not connected completely, "P09" will be displayed on the remote controller.)**
  - **Check that the wiring connector is not caught between the electrical component box and the cover.**
  - **Check that the wiring connector is not caught between the unit and the panel for cassette.**

#### (5) How to Attach the Corner & Air-Intake Grille

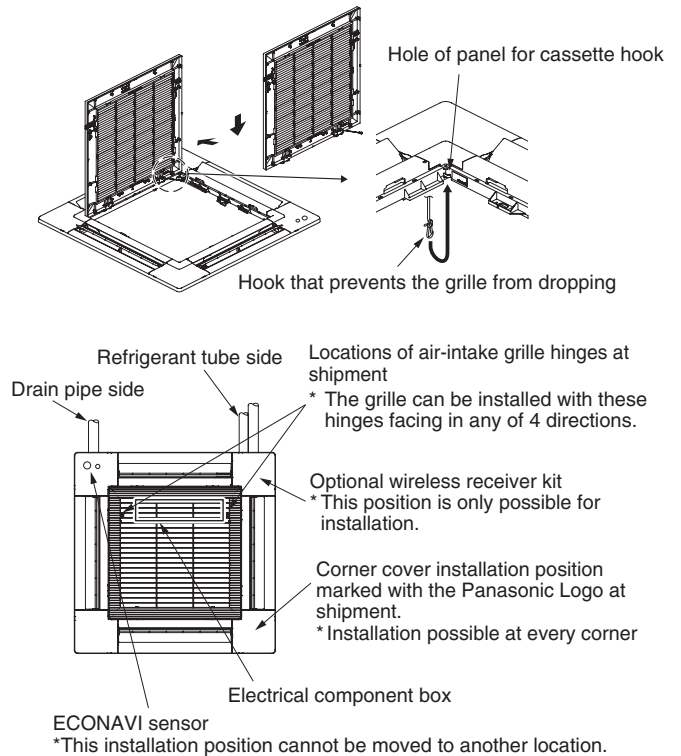

##### A. Attaching the corner cover

- 1) Check that the safety cord from the corner cover is fastened to the panel for cassette pin, as shown in the figure below.
- 2) Use the supplied screws to attach the corner cover to the panel for cassette.

##### B. Attaching the air-intake grille

- To install the air-intake grille, follow the steps for "Removing the grille" in the reverse order. By rotating the air-intake grille, it is possible to attach the grille onto the panel for cassette from any of 4 directions. Coordinate the directions of the air-intake grilles when installing multiple units, and change the directions according to customer's requests.
- When attaching the air-intake grille, be careful that the flap lead wire does not become caught.
- Be sure to attach the safety cord that prevents the air-intake grille from dropping off to the panel for cassette unit as shown in the figure below.
- With this panel for cassette, the directions of the air-intake grille lattices when installing multiple units, and the position of the label showing the company name on the corner panel, can be changed according to customer's requests, as shown in the figure below. However, the wireless signal receiver can only be installed at the refrigerant-tubing corner of the ceiling unit.

■ Others

(1) Checking After Installation

- 1) Check that there are no gaps between the unit and the panel for cassette, or between the panel for cassette and the ceiling surface.

\* Gaps may cause water leakage and condensation.

- 2) Check that the wiring is securely connected.

\* If it is not securely connected, the auto flap will not operate.

("P09" is displayed on the remote controller.)

In addition, the water leakage and condensation may occur.

(2) Operating the Wireless Remote Controller

For details of installation, refer to the section "Wireless Signal Receiver" in the supplied installation instructions.

(3) Selecting DC Fan Motor Tap (4-Way Cassette)

Check the optional parts accordingly in the following table.

**Table for DC Fan Motor Tap Settings**

| Setting No. | Remote controller setting data Item code 5d | Contents & optional parts name                    |
|-------------|---|---|
| (1)         | 0001  | Air-flow blocking kit (for 3-way air flow)*2      |
|             |   | Air-flow blocking kit (when a duct is connected.) |
|             |   | High-ceiling setting 1*2                          |
| (3)         | 0003  | High-ceiling setting 2*2                          |
| (6)         | 0006  | Air-flow blocking kit (for 2-way air flow)*2      |

\*1 When using optional parts in different setting No. in combination with multiple units, conform it to the larger setting No.

\*2 Ceiling height (m)

| Indoor unit type                           | 36,45,50 | 60,71 | 100,125,140 |
|--|----------|-------|-------------|
| Standard (factory setting)                 | 2.7      | 3.0   | 3.6         |
| High-ceiling setting 1                     | 3.2      | 3.3   | 4.3         |
| High-ceiling setting 2                     | 3.5      | 3.6   | 5.0         |
| Air-flow blocking kit (for 3-way air flow) | 3.8      | 3.8   | 4.7         |
| Air-flow blocking kit (for 2-way air flow) | 4.2      | 4.2   | 5.0         |

1) When setting on the P.C. Board

<Procedure>

**Stop the system before performing these steps.**

- ① Open the electrical component box cover, then check the indoor unit control PCB.
- ② Change the DIP switch on the indoor unit control PCB in accordance with the setting number which was confirmed in Table for DC Fan Motor Tap Settings.

| Setting No. | DIP switch | Setting No. | DIP switch |
|-------------|------------|-------------|------------|
| (1)         |            | (6)         |            |
| (3)         |            |             |            |

**<Procedure of CZ-RTC5A>**

**Stop the system before performing these steps.**

- ① Keep pressing the , and buttons simultaneously for 4 or more seconds. The "Maintenance func" screen appears on the LCD display.

- ② Press the or button to see each menu. If you wish to see the next screen instantly, press the or button. Select "8. Detailed settings" on the LCD display and press the button.

The "Detailed settings" screen appears on the LCD display.

- ③ Select the "Unit no." by pressing the  or  button for changes.

| Detailed settings |          | 20:30 (THU) |
|-------------------|----------|-------------|
| Unit no.          | Code no. | Set data    |
| 1-1               | 10       | 0001        |
| Sel.              |          | Next        |

- ④ Select the "Code no." by pressing the  or  button.

Change the "Code no." to "5D" by pressing the  or  button (or keeping it pressed).

- ⑤ Select the "Set data" by pressing the  or  button.

Select one of the "Set data" in "Table for DC Fan Motor Tap Settings" by pressing the  or  button.

Then press the  button.

| Detailed settings |          | 20:30 (THU)       |
|-------------------|----------|-------------------|
| Unit no.          | Code no. | Set data          |
| 1-1               | 5D       | 0003              |
| Sel.              |          | [confirm] Confirm |

- ⑥ Press the  button.  
The "Exit detailed settings and restart?" (Detailed setting-end) screen appears on the LCD display.  
Select "YES" and press the  button.

| Detailed settings                   |  | 20:30 (THU) |
|-------------------------------------|--|-------------|
| Exit detailed settings and restart? |  |             |
| YES                                 |  | NO          |
| Sel.                                |  | Next        |

If you wish to change the selected indoor unit, follow the step ②.

#### <Procedure of CZ-RTC4>

**Stop the system before performing these steps.**

- ① Press and hold the ,  and  buttons simultaneously for 4 seconds or longer.
- ② If group control is in effect, press the  button to set. At this time, the fan at the indoor unit begins and select the address (unit No.) of the indoor unit operating.
- ③ Designate the item code **5d** by adjusting the Temperature Setting / buttons.
- ④ Press the timer time / buttons to select the desired setting data.  
\*For item codes and setting data, refer to "Table for DC Fan Motor Tap Settings".
- ⑤ Press the  button.  
(The display stops blinking and remains lit, and setting is completed.)  
If you wish to change the selected indoor unit, follow the step ②.
- ⑥ Press the  button to return to normal remote controller display.

#### (4) Setting the Flap Separately

- 1) The 4-air outlet flap can be adjusted separately during operation. When not adjusted separately, all flaps operate in the same manner.

<Procedure of CZ-RTC5A>

Stop the system before performing these steps.

- ① Keep pressing the , and buttons simultaneously for 4 or more seconds. The "Maintenance func" screen appears on the LCD display.

- ② Press the or button to see each menu. If you wish to see the next screen instantly, press the or button. Select "8. Detailed settings" on the LCD display and press the button.

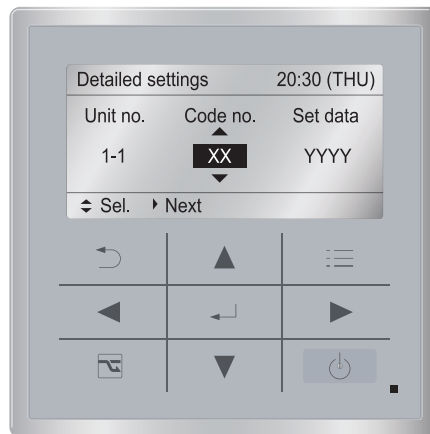

The "Detailed settings" screen appears on the LCD display.

- ③ Select the "Unit no." by pressing the or button for changes.

- ④ Select the "Code no." by pressing the or button. Change the "Code no." to "XX" by pressing the or button (or keeping it pressed).

- ⑤ Select the "Set data" by pressing the or button. Select one of the Setting Data "YYYY" by pressing the or button. Then press the button.

Flap position

\* Setting data "YYYY"

| Setting data | Flap position during operation |
|--------------|--------------------------------|
| 0000         | Without separate setting       |
| 0001         | Swing                          |
| 0002         | Move to position 1 and stay    |
| 0003         | Move to position 2 and stay    |
| 0004         | Move to position 3 and stay    |
| 0005         | Move to position 4 and stay    |
| 0006         | Move to position 5 and stay    |

**NOTE**

The flap swings during the operation under "Setting the Flap Separately". At this time, the unselected flaps are moved to the position 1.

- ⑥ Press the button. The "Exit detailed settings and restart?" (Detailed setting-end) screen appears on the LCD display. Select "YES" and press the button.

If you wish to change the selected indoor unit, follow the step (2).

<Procedure of CZ-RTC4>

Stop the system before performing these steps.

- (1) Press and hold the , and buttons simultaneously for 4 seconds or longer.
- (2) If group control is in effect, press the button to set. At this time, the fan at the indoor unit begins and select the address (unit No.) of the indoor unit operating.
- (3) Designate the item code "XX" by adjusting the Temperature Setting / buttons.

- (5) Press the button.  
(The display stops blinking and remains lit, and setting is completed.)  
If you wish to change the selected indoor unit, follow the step (2).
- (6) Press the button to return to normal remote controller display.

- (4) Press the timer time / buttons to select the desired setting data.

\* Setting data "YYYY"

| Setting data | Flap position during operation |
|--------------|--------------------------------|
| 0000         | Without separate setting       |
| 0001         | Swing                          |
| 0002         | Move to position 1 and stay    |
| 0003         | Move to position 2 and stay    |
| 0004         | Move to position 3 and stay    |
| 0005         | Move to position 4 and stay    |
| 0006         | Move to position 5 and stay    |

**NOTE**

The flap swings during the operation under "Setting the Flap Separately".  
At this time, the unselected flaps are moved to the position 1.

## ECONAVI SYSTEM SETTING

Change the settings of main and sub indoor units to correspond to the ECONAVI system function.  
For the benefit of using the ECONAVI function, the main indoor unit should be provided with the ECONAVI function.

1. Press three buttons.

Keep pressing the ,  and  buttons simultaneously for more than 4 seconds.

The "Maintenance func" menu appears on the screen.

2. Select "0. ECONAVI info." from the menu command.

By pressing the  /  buttons, select "0. ECONAVI info." and press the  button.

3. Select "System settings" from the menu command.

By pressing the  /  buttons, select "System settings" and press the  button.

### NOTE

● After operating Step 2, the following messages may occasionally appear on the screen.

| Display message           | Contents   |
|---------------------------|--|
| Disabled in default mode. | After a while, select "0. ECONAVI info." again.<br>If no status changes even after 10 minutes, make auto address setting and then select "0. ECONAVI info.". |

● After operating Step 3, the following messages may occasionally appear on the screen.

| Display message                        | Contents   |
|--|--|
| Setup is not required.                 | The main indoor unit has already been provided with the ECONAVI function.<br>So, it works right out of the box.              |
| Main indoor unit is not found.         | The power of indoor unit may possibly shut down.<br>Check the power supply of indoor unit.                                   |
| Indoor unit with ECONAVI is not found. | Since all indoor units in the group control are not available for the ECONAVI function, the ECONAVI function cannot be used. |

4. Start settings.

By pressing the  /  buttons, select "YES" and press the  button.

5. When finished settings, the system restarts automatically.

6. Check whether the ECONAVI function is set.

**ECONAVI** is displayed on the screen.

If the display is not operated, press the  button and set it in operating mode.

If operation is in fan mode, **ECONAVI** is not displayed. Set in any operating mode other than fan mode.

"**ECONAVI**" is displayed when setting the ECONAVI function.

## ■ ECONAVI TEST OPERATION

Preparation: Refer to the manuals of the indoor unit and turn on the main power switch in advance.  
Human detection cannot be made for approx. 90 seconds when switched on the power because the human detection sensor is set in initial setup.

### 1. Press three buttons.

Keep pressing the ,  and  buttons simultaneously for more than 4 seconds.

The "Maintenance func" menu appears on the screen.

### 2. Select "0. ECONAVI info." from the menu command.

By pressing the  /  buttons, select "0. ECONAVI info." and press the  button.

|   |  |
|---|--|
|  Maintenance func | 20:30 (THU)  |
| 0. ECONAVI info.  |  |
| 1. Outdoor unit error data  |  |
| 2. Service contact  |  |
| 3. RC. setting mode   |  |
| ▼ Sel.  | ▶ Page [  ] Confirm |

### 3. Select "Error found" from the menu command.

By pressing the  /  buttons, select "Error found" and press the  button.

|                   |   |
|-------------------|---|
| ECONAVI info.     | 20:30 (THU)   |
| Sensor unit info. |   |
| System settings   |   |
| Status info.      |   |
| Error found       |   |
| ▲ Sel.            | [  ] Check |

### 4. Check the sensor status shows "Normal".

(By pressing the  /  buttons, the status of each indoor unit can be scrolled on the screen.)

The sensor status of all indoor units are displayed.

- "Normal": The sensor on the panel for cassette (ECONAVI type) works normally.
- "Preparing": The sensor on the panel for cassette (ECONAVI type) is set in initial setup. Confirm that "Normal" appears within 90 seconds.
- "Unsupported": Indoor units not available for ECONAVI function.

|             |               |
|-------------|---------------|
| Error found | 20:30 (THU)   |
| Unit no.    | Status        |
| 1 - 1       | Normal        |
| 1 - 2       | Normal        |
| Sensor 1    | Not connected |
| ▲ Scroll    |               |

The test run procedure described above is over. If any display appears other than "Normal" or "Preparing" even though the ECONAVI panel is connected, follow the Step 5 below.

\* "1-1", "1-2" mean indoor unit No. If the indoor unit is without ECONAVI panel, "Not connected" appears.

\* "Sensor 1" means optional ECONAVI sensor (CZ-CENSC1). If not connected, "Not connected" appears besides "Sensor 1" on the screen.

### 5. If the sensor status shows other than "Normal", "Preparing",

"Error" or "Not connected" although the panel for cassette (ECONAVI type) is connected, the following symptom may have occurred. Specify the applicable indoor unit and check the sensor.  
"Error": The sensor may possibly be damaged.

"Not connected": The wiring between the indoor unit and sensor may possibly be disconnected.

\* The specified indoor unit can be confirmed by the flap operation.

Confirmation method:

#### ① Finish the maintenance function.

Press the  button to show the maintenance function display and then press the  button.

#### ② Operate the flap.

By pressing the  button, select the applicable "Indoor Unit No." in the list of "2. FLAP" and then make flap setting. The indoor unit which responds to the flap setting becomes available.

When the indoor unit is specified, turn off the main power switch and disconnect the connector of sensor wiring from the PCB. Then reconnect it. Turn on the main power switch and repeat the Steps 1 to 4 described above. Confirm the display shows "Error found". If the display shows "Error" or "Not connected" on the screen again, it is necessary to replace the panel for cassette (ECONAVI type) with a new one.

## EXTERNAL DEVICE INTERLOCK

Example of wiring:

This is an example of the combination systems which extract optional output signal by the service wire and relay (field supply). When actuating the external device interlock, use the thermostat signal.

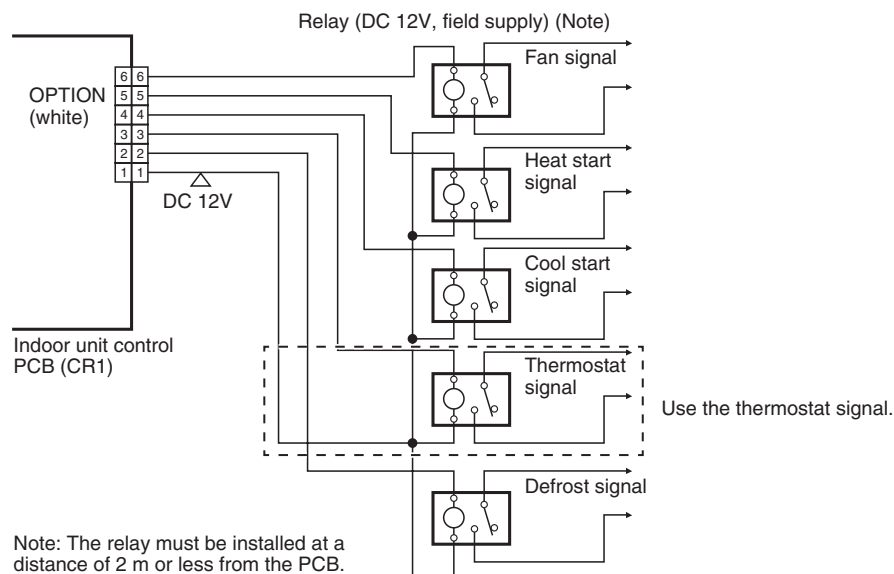

### OPTION Connector (CN060) Output external signals

PAW-OCT: Panasonic has developed an optional accessory (consisting of plug + wires) called PAW-OCT to enable an easy connection to this OPTION Connector (CN060).

With the combination of the T10 and the OPTION Connector (CN060) an external control of the I\_U is possible!

6P (WHITE): OUTPUTS EXTERNAL SIGNALS AS SHOWN IN THE FIGURE BELOW.

### NOTE

- The external output signal from the air conditioner is supplied for the purpose of controlling the external devices. If the air conditioner does not operate, take measures that the movement of external connecting devices can transfer to the safety zone in advance.
- The external output signal from the air conditioner is turned off when the blackout occurs. If any special considerations are needed in case of blackout, provide an external circuit.

## ■ CHECKLIST AFTER INSTALLATION WORK

| Work List       | No.         | Content   | Check <input checked="" type="checkbox"/>   | Possibility of Failure & Checkpoint   |
|-----------------|-------------|---|---|---|
| Installation    | 1           | Are the indoor units installed following the content on page 1-11-3-1 "■ SELECTING THE INSTALLATION SITE"?                                | <input type="checkbox"/>  | There is a possibility of light injure or loss of property.   |
| Tubing & Wiring | 2           | In the case of multiple installation: Is there a wrong tubing connection with another system?   | <input type="checkbox"/>  | The unit is inoperated or the refrigerant flows into the inoperative unit and the leakage is expected. Check if there is a wrong tubing or wiring connection with another system. |
|                 | 3           | In the case of multiple installation: Is there a wrong wiring connection with another system?   | <input type="checkbox"/>  |   |
|                 | 4           | Is the earth leakage circuit breaker (all-pole switching function provided) installed?  | <input type="checkbox"/>  |   |
|                 | 5           | Is there any wrong installation of optional parts or wrong wiring?  | <input type="checkbox"/>  | Power failure or short circuit may cause electric shock or fire. Check installation work and ground wire work.  |
|                 | 6           | Was the ground wire work performed?   | <input type="checkbox"/>  |   |
|                 | 7           | Are there any wrong power supply wiring, wrong connection wire, wrong signal wire or loose screw?   | <input type="checkbox"/>  |   |
|                 | 8           | Is the thickness of wire in accordance with rule?   | <input type="checkbox"/>  |   |
|                 | 9           | Is the power-supply voltage equal to the nameplate of the unit?   | <input type="checkbox"/>  |   |
|                 | 10          | Was the check of the airtight test, flared tube fitting and gas leakage on the welded portion performed?                                  | <input type="checkbox"/>  | If the gas leakage occurs, the unit quality not only becomes inferior but affects environment. Repair it as quickly as possible.  |
|                 | Drain Check | 11  | Has the adhesive been applied to the drain connecting portion (resin portion) of the indoor unit? | <input type="checkbox"/>  |
| 12              |             | Is there water leakage?   | <input type="checkbox"/>  | Since there is a possibility of water drain, repair the drain pipe if the drain failure or water drain occurs.  |
| 13              |             | Indoor unit drain pipe has a downward gradient (1/100 or more) by rule. Is the drain water flowing smoothly?                              | <input type="checkbox"/>  |   |
| Heat Insulation | 14          | Was the heat insulation work at a suitable location including the flared tube fitting (refrigerant tube & drain pipe) performed properly? | <input type="checkbox"/>  | The quality of unit not only becomes inferior but there is a possibility of the water drain. So, perform the heat insulation work properly.                                       |
| Optional Parts  | 15          | Was the short-circuit connector connected or the fan tap changed when installing the air-blocking material?                               | <input type="checkbox"/>  | The discharge temperature decreases in cooling mode according to the reduction of air volume and there is a possibility of dew drops. Be sure to change settings.                 |
| Test Run        | 16          | Did the abnormal sound occur?   | <input type="checkbox"/>  | Check if there is a fan contact or distortion of the indoor unit.   |
|                 | 17          | Did the cool and warm airflow discharge from the indoor unit?   | <input type="checkbox"/>  | Check if the unit does not operate or there is a wrong tubing or wiring connection with another system.   |

**Optional Parts**

■ **Air Intake Chamber**

**CZ-FDU3**

**Installation Instructions**

**Accessory parts**

The accessory parts are required for the installation work so they should not be discarded until the work is completed.

- The following parts are provided inside the package so check that they are accounted for.

| Part name   | No. of parts | Part name  | No. of parts | Part name  | No. of parts |
|---|--------------|--|--------------|--|--------------|
| Screws<br>(5 x 40)<br><br>(Used to secure this<br>Air intake chamber) | 4            | Washers<br><br>(Used to secure this<br>Air intake chamber) | 4            | Installation instructions<br><br> | 1            |

**Mounting procedure**

Before proceeding with the mounting, remove the cushions which have been inserted into the air outlets (in 4 places).

<1> Mounting Air intake chamber (Fig. 1-11-3-1)

- Place the black sealant side of Air intake chamber toward the indoor unit.  
(Air intake chamber can be mounted correctly in only one way so ensure that the shapes of the indoor unit and chamber are aligned properly.)
- Use the accessory screws (x4) to secure the indoor unit and Air intake chamber.

<2> Installing the indoor unit

- Install the indoor unit with Air intake chamber mounted on it to the ceiling.  
(Now proceed with the installation in accordance with the installation instructions provided with the indoor unit.)

**Fig. 1-11-3-1**

<3> Mounting the ceiling panel (Fig. 1-11-3-2)

- Mount the ceiling panel to the indoor unit (with Air intake chamber).  
(For details on how the ceiling panel is to be mounted, refer to the installation instructions which are provided with the ceiling panel.)

<4> Connecting the panel cables (Fig. 1-11-3-2)

- Remove the cover of Air intake chamber, and remove the cover of electrical component box.
- Cut the clamp used to bundle the ceiling panel cable, insert the 22P connector (white) of the cable into the through-hole in Air intake chamber, and connect it to the 22P connector inside the electrical component box.
- Return the cover of electrical component box and the cover of Air intake chamber to their original positions.

Mounting procedure (continued)

Fig. 1-11-3-2

## Selecting the DC fan motor taps

It is necessary to set the fan speed in accordance with the intended application and the optional parts to be used if any such part is used. (Table 1-11-3-1)

If this speed is not changed, a reduction in the air flow may result, causing the air outlet temperature to drop and condensation to form during cooling.

There are two ways to set the fan speed: either (1) change the positions of the DIP switches on the indoor unit control PCB or (2) set the speed using the wired remote controller. Select one of these ways.

\* Priority is given to setting the fan speed by changing the positions of the DIP switches.

**Table 1-11-3-1 DC fan motor tap setting table**

| Setting No | Item code 5D/5d setting data | Intended application / name of optional parts         | Setting No | Item code 5D/5d setting data | Intended application / name of optional parts         |
|------------|------------------------------|---|------------|------------------------------|---|
|            | 0000                         | Standard (factory setting)                            | (1)        | 0001                         | Air-flow blocking kit(for 3-way air flow)             |
| (1)        | 0001                         | High-ceiling setting 1 (with standard, ECONAVI panel) | (3)        | 0003                         | High-ceiling setting 2 (with standard, ECONAVI panel) |
|            |                              | Air-flow blocking kit (when a duct is connected.)     | (6)        | 0006                         | Air-flow blocking kit (for 2-way air flow)            |

### (1) When setting the fan speed by changing the positions of the DIP switches on the indoor unit control PCB

<Procedure> Be absolutely sure to turn off the power (earth-leakage circuit breaker).

<1> On Table 1-11-3-1, check out the "Setting No." that corresponds to the intended application and the optional parts to be used.

<2> Open the cover of the electrical component box, and check the indoor unit control PCB. (Fig.1-11-3-3)

<3> Select the Setting No. which was checked out on Table 1-11-3-1, and change the positions of the DIP switches on the indoor unit control PCB.

**Fig. 1-11-3-3 Indoor unit control PCB**

### (2) When setting the fan speed using a wired remote controller (optional parts: CZ-RTC5A)

On Table 1-11-3-1, check out the "Item code 5D setting data" that corresponds to the intended application and the optional parts to be used.

<Procedure> Ensure that the unit has stopped operating before changing the fan speed.

<1> Hold down the + + buttons together for at least 4 seconds. The maintenance function screen is displayed.

<2> Use the / buttons to select the display and the / buttons to select the page.

Select "8. Detailed settings" and press the button.

The [Detailed settings screen] appears.

Using the / buttons, select the unit No.

<3> Using the / buttons, select the item code.

Using the / buttons, change the item code to "5D."

<4> Using the / buttons, select the setting data.

Using the / buttons, change the setting data to the value checked out on Table 1-11-3-1, and press the button.

<5> After selecting the unit No. using the / buttons, press the button. The [Detailed settings completion screen] appears.

Select "Yes", and press the button.

### (3) When setting the fan speed using a wired remote controller (optional parts: CZ-RTC4)

On Table 1-11-3-1, check out the "Item code 5d setting data" that corresponds to the intended application and the optional parts to be used.

<Procedure> Ensure that the units have stopped operating before changing the fan speed.

<1> Hold down the + + buttons together for at least 4 seconds.

<2> Each time the button is pressed, the numbers of the indoor units under group control are displayed in sequence.

The fan motor of only the indoor unit that has been selected will run.

<3> Specify item code "5d" using the temperature setting / buttons.

<4> Change the setting data using the hour - buttons. The setting data details are as given on Table 1-11-3-1.

<5> Press the button. (OK if the display changes from flashing to lighted.)

<6> Press the button. The normal stop status is established.

Go to step <2> to change the selected indoor unit.

<7> Press the button. The normal stop status is established.

■ Air-flow Blocking Kit

CZ-CFU3

Installation Instructions

Accessory parts

The accessory parts are required for the installation work so they should not be discarded until the work is completed.

| Part name                     | No. of parts | Part name          | No. of parts | Part name                 | No. of parts |
|-------------------------------|--------------|--------------------|--------------|---------------------------|--------------|
| Air-flow blocker (470×65×T10) | 3            | Sealer (570×90×T2) | 2            | Installation instructions | 1            |
| A:2                           |              |                    |              |                           |              |
| B:1                           |              |                    |              |                           |              |

Mounting procedure

(1) Checking where the air-flow blocker is to be attached

For Air outlet<1>

When Air-flow blocker A is to be attached, cut it in parallel with the slit. (Fig. 1-11-3-4)

For Air outlet<2>

Air-flow blocker B can be used as is.

For Air outlet<3>or<4>

Air-flow blocker A can be used as is.

Fig. 1-11-3-4

(2) Fit the air-flow blocker into place to match the shape of the air outlet, adhere the tape of the both side of air-flow blocker to the drain pan and adhere the sealer on top to block the passage of air. (Fig. 1-11-3-5) (Fig. 1-11-3-6)

Fig. 1-11-3-5

(3) Adhere the sealer to the drain pan with an overlap of 10 mm or more. (Condensation may form if it is adhered with no overlap.)

- (Fig. 1-11-3-7)
  - \*1 Ensure that the sealer does not come into contact with the corner metal fitting.
  - \*2 Cut the sealer diagonally so that no contact is made with the wire.
- Fold the protruding parts of the sealer over the side panel, and adhere them into place.

Fig. 1-11-3-6

Fig. 1-11-3-7

### Air outlet blocking patterns

#### As seen from underneath the indoor unit

- When a 2- or 3-way air outlet configuration is used or when the air outlet duct connection flange (Φ150):field supply is connected, block the air outlets as per the air outlet blocking patterns illustrated below.

Also, refer to the table below, and decide on where the pipings are to be positioned.

(To better understand what the illustrations show, refer to the figure on the right.)

Note: Take care to prevent cold air leaks and deficient insulation while performing the air outlet duct connection flange (Φ150):field supply work in order to prevent condensation from forming.

- It should be borne in mind that any air outlet blocking pattern with the hatching mark will make it impossible for the “nanoe” nano-technology fine particle function to work.
- Under no circumstances must any air outlet blocking patterns not shown in the table below be used.

|   |  |  |  |  |
|---|--|--|--|--|
| 3-way air outlet<br>One outlet can be blocked.  |  |  |  |  |
| 2-way air outlet<br>Two outlets can be blocked.   |  |  |  |  |
|   |  |  |  |  |
| Air outlet duct connection flange (Φ150):field supply connection 3-way air outlet<br>One outlet can be blocked and connected to a duct.   |  |  |  |  |
| Air outlet duct connection flange (Φ150):field supply connection 2-way air outlet<br>Two outlets can be blocked and connected to a duct.<br><br>Note: The duct can be connected only in one of the locations shown. |  |  |  |  |
|   |  |  |  |  |
|   |  |  |  |  |

#### Changing the DC fan tap settings

While referring to “Selecting the DC fan motor taps,” change the DC fan speed by using the wired remote controller or by setting the DIP switches on the indoor unit control PCB.

## Selecting the DC fan motor taps

It is necessary to set the fan speed in accordance with the intended application and the optional parts to be used if any such part is used. (Table 1-11-3-2)

If this speed is not changed, a reduction in the air flow may result, causing the air outlet temperature to drop and condensation to form during cooling.

There are two ways to set the fan speed: either (1) change the positions of the DIP switches on the indoor unit control PCB or (2) set the speed using the wired remote controller. Select one of these ways.

\* Priority is given to setting the fan speed by changing the positions of the DIP switches.

**Table 1-11-3-2 DC fan motor tap setting table**

| Setting No | Item code 5D/5d setting data | Intended application / name of optional parts         | Setting No | Item code 5D/5d setting data | Intended application / name of optional parts         |
|------------|------------------------------|---|------------|------------------------------|---|
|            | 0000                         | Standard (factory setting)                            | (1)        | 0001                         | Air-flow blocking kit(for 3-way air flow)             |
| (1)        | 0001                         | High-ceiling setting 1 (with standard, ECONAVI panel) | (3)        | 0003                         | High-ceiling setting 2 (with standard, ECONAVI panel) |
|            |                              | Air-flow blocking kit (when a duct is connected.)     | (6)        | 0006                         | Air-flow blocking kit (for 2-way air flow)            |

### (1) When setting the fan speed by changing the positions of the DIP switches on the indoor unit control PCB

<Procedure> Be absolutely sure to turn off the power (earth-leakage circuit breaker).

- <1> On Table 1-11-3-2, check out the "Setting No." that corresponds to the intended application and the optional parts to be used.
- <2> Open the cover of the electrical parts box, and check the indoor unit control PCB. (Fig. 1-11-3-8)
- <3> Select the Setting No. which was checked out on Table 1-11-3-2, and change the positions of the DIP switches on the indoor unit control PCB.

| Setting No. | DIP switch  |
|-------------|---|
| (1)         | <p>DIP switch "ON" position</p> <p>"OFF" position</p> |
| (3)         | <p>DIP switch "ON" position</p> <p>"OFF" position</p> |
| (6)         | <p>DIP switch "ON" position</p> <p>"OFF" position</p> |

**Fig. 1-11-3-8**  
Indoor unit control PCB

### (2) When setting the fan speed using a wired remote controller (optional parts: CZ-RTC5A)

On Table 1-11-3-2, check out the "Item code 5D setting data" that corresponds to the intended application and the optional parts to be used.

<Procedure> Ensure that the unit has stopped operating before changing the fan speed.

- <1> Hold down the + + buttons together for at least 4 seconds. The maintenance function screen is displayed.
- <2> Use the / buttons to select the display and the / buttons to select the page.  
Select "8. Detailed settings" and press the button. The [Detailed settings screen] appears.  
Using the / buttons, select the unit No.
- <3> Using the / buttons, select the item code.  
Using the / buttons, change the item code to "5D."
- <4> Using the / buttons, select the setting data.  
Using the / buttons, change the setting data to the value checked out on Table 1-11-3-2, and press the button.
- <5> After selecting the unit No. using the / buttons, press the button. The [Detailed settings completion screen] appears.  
Select "Yes", and press the button.

Unit No.      Setting data  
Item code

### (3) When setting the fan speed using a wired remote controller (optional parts: CZ-RTC4)

On Table 1-11-3-2, check out the "Item code 5d setting data" that corresponds to the intended application and the optional parts to be used.

<Procedure> Ensure that the units have stopped operating before changing the fan speed.

- <1> Hold down the + + buttons together for at least 4 seconds.
- <2> Each time the button is pressed, the numbers of the indoor units under group control are displayed in sequence.  
The fan motor of only the indoor unit that has been selected will run.
- <3> Specify item code "5d" using the temperature setting / buttons.
- <4> Change the setting data using the hour buttons. The setting data details are as given on Table 1-11-3-2.
- <5> Press the button. (OK if the display changes from flashing to lighted.)
- <6> Press the button. The normal stop status is established.  
Go to step <2> to change the selected indoor unit.
- <7> Press the button. The normal stop status is established.

■ Thermal Insulation Kit

CZ-INSU3

Installation Instructions

Parts installed on the indoor unit

● Details of parts

|              |   |   |  |   |
|--------------|---|---|--|---|
| Part name    | Side panel insulator  | Side panel insulator  | Side panel insulator   | Side panel insulator  |
| Shape        |    |    |    |  |
| No. of parts | 1   | 1   | 1  | 1   |
| Part name    | Side panel insulator  | Side panel insulator  | Ceiling insulator  | Ceiling insulator   |
| Shape        |    |    |    |  |
| No. of parts | 1   | 1   | 1  | 1   |
| Part name    | Ceiling insulator   | Hanger insulator  | Installation instructions  |   |
| Shape        |  |  |  |   |
| No. of parts | 1   | 4   | 1  |   |

● Procedure for attaching the parts

\* Indoor unit has two kinds of heights.(Large unit=319mm, Small unit=256mm)  
 When attaching the side panel insulator to the small unit, attach it after cutting along its perforations of the parts<1> to <5>

1. Align the slits of the side panel insulators <1> to <4> with the hanger, and attach the parts to the side panels of the indoor unit. (Fig. 1-11-3-9)
2. Now attach the side panel insulator <5> to the side panel of the indoor unit. (Fig. 1-11-3-9)
3. Align the side panel insulator <6> with the piping cover, and attach the part. (Fig. 1-11-3-9)
4. Attach the ceiling insulators <7> to <9> in such a way that no gaps are left. (Fig. 1-11-3-10)

Do the following procedures after installing the indoor unit.

5. Attach the hanger insulators <10> to the hangers in the directions shown in the figure. (Fig. 1-11-3-11)

\* Keep hanger insulator<10> until installing the indoor unit.

## Parts installed on the indoor unit (continued)

Fig. 1-11-3-9

Fig. 1-11-3-10

When attaching the insulators, ensure that they overlap. (Side insulators <1> to <5>)

Fig. 1-11-3-11

Parts mounted on ceiling panels

● Details of parts

| Part name    | Insulator   | Insulator   | Insulator   | Insulator  | Insulator   | Insulator   |
|--------------|---|---|---|--|---|---|
| Shape        |  <p>&lt;11&gt;</p> |  <p>&lt;12&gt;</p> |  <p>&lt;13&gt;</p> |  <p>&lt;14&gt;</p> |  <p>&lt;15&gt;</p> |  <p>&lt;16&gt;</p> |
| No. of parts | 2   | 1   | 1   | 2  | 1   | 1   |

● Procedure for attaching the parts

1. Remove the covers in the four corners. (Fig. 1-11-3-12)
2. Fit the ceiling panel to the indoor unit.  
(For details on how the ceiling panel is to be fitted, refer to the installation instructions which are provided with the ceiling panel.)
3. Fit the insulators <11> to <13> onto the four corners of the ceiling panel exactly as shown in Fig. 1-11-3-13.
4. Fit the cover in place. The cover can fall off in this state so be absolutely sure to secure it in place using the fixing screws.

<When mounting the parts onto the receivers (Fig. 1-11-3-14)>

Cut out along the perforations the insulators <11>, <12> and/or <13> that fit the mounting location, mount them by matching them to the shape of each receiver, and attach the covers to the ceiling panel.

\* Be absolutely sure to use the maximum dimensions of 910 mm x 910 mm for the extent of the ceiling opening so that the ceiling surface and insulators will not absorb any shocks.

(For details on how the ceiling panel is to be fitted, refer to the installation instructions which are provided with the ceiling panel.)

For Wireless remote controller receiver

For ECONAVI panel

Fig. 1-11-3-14

#### 4. Ceiling Type (T2)

##### ■ SELECTING THE INSTALLATION SITE

###### Indoor Unit

###### AVOID:

- areas where leakage of flammable gas may be expected.
- places where large amounts of oil mist exist.
- direct sunlight.
- locations near heat sources which may affect the performance of the unit.
- locations where external air may enter the room directly. This may cause "condensation" on the air discharge ports, causing them to spray or drip water.
- locations where the remote controller will be splashed with water or affected by dampness or humidity.
- installing the remote controller behind curtains or furniture.
- locations where high-frequency emissions are generated.

###### DO:

- select an appropriate position from which every corner of the room can be uniformly cooled.
- select a location where the ceiling is strong enough to support the weight of the unit.
- select a location where tubing and drain pipe have the shortest run to the outdoor unit.
- allow room for operation and maintenance as well as unrestricted air flow around the unit.
- install the unit within the maximum elevation difference above or below the outdoor unit and within a total tubing length (L) from the outdoor unit as detailed in the Installation Instructions provided with the outdoor unit.
- allow room for mounting the remote controller about 1 m off the floor, in an area that is not in direct sunlight or in the flow of cool air from the indoor unit.

###### NOTE

The rear of the indoor unit can be installed flush against the wall.

■ HOW TO INSTALL THE INDOOR UNIT

Unit: mm

■ Ceiling Type (Type T2)

4-1. Required Minimum Space for Installation and Service

(1) Dimensions of suspension bolt pitch and unit

| Type \ Length | A    | B    | C   |
|---------------|------|------|-----|
| 36, 45, 50    | 911  | 960  | 235 |
| 60, 71        | 1226 | 1275 | 235 |
| 100, 125, 140 | 1541 | 1590 | 235 |

Unit: mm

Fig. 1-11-4-1

Unit: mm

(2) Refrigerant tubing • drain hose position

Fig. 1-11-4-2

(3) Unit opening position (Refrigerant tubing • drain hose • power inlet port • remote control wiring inlet port)

Unit: mm

\*1 Use a compass saw, jigsaw or similar tool and cut along the indented portion of the side cover and make a hole inside the cover.

\*2 When removing the refrigerant tubing from the upper side, cut along the indented portion and pass the tubing through the hole.

**NOTE**

Be sure to use sealing putty to seal off the opening to prevent dust.

Fig. 1-11-4-3

### 4-2. Preparation Before Installation

- (1) Remove the bracket (for suspending the indoor unit).  
Loose the M8 suspension bolts.  
Then remove the bracket. (Fig. 1-11-4-4)

**NOTE**

Keep the M8 suspension bolts fixed on to the bracket loose.  
Loosen the M8 suspension bolts and expose the axis of bolts less than 8 mm.

Fig. 1-11-4-4

- (2) Remove the air-intake grille before suspending the indoor unit. First, remove 2 attachment screws fixed with the latches. Open the air-intake grille and hold the claws of the hinges on both sides. Then remove the air-intake grille and suspension lug located on the left and right side of the indoor unit.

Fig. 1-11-4-5

Fig. 1-11-4-6

- (3) Remove the side plate to the tubing side.

|                                     |   |
|-------------------------------------|---|
| Rear & upper side tubing connection | Remove 2 screws.<br>Slide the side plate in the direction of the arrow and remove it. |
| Right side tubing connection        | Do not remove the side plate.   |

Fig. 1-11-4-7

- (4) Remove the center bracket.  
When wiring, remove the center bracket if necessary.  
When wiring is completed, reinstall the center bracket in its original position.

Fig. 1-11-4-8

### 4-3. Suspending the Indoor Unit

**NOTE**

Since the diagram is made of paper, it may shrink or stretch slightly because of high temperature or humidity. For this reason, before drilling the holes maintain the correct dimensions between the markings.

- (1) If the full-scale installation diagram is placed on the ceiling, the locations of each suspension bolt can be chosen. Take a pencil and mark the drill holes (Fig. 1-11-4-9).

Fig. 1-11-4-9

- (2) If the full-scale installation diagram is bent at right angle to the ceiling and wall, the locations of the inlet for indoor tubing and wiring are chosen and the locations of each suspension bolt can also be chosen. Take a pencil and mark the drill holes (Fig. 1-11-4-10).

Fig. 1-11-4-10

**NOTE**

The dimension when the indoor unit is placed tightly against the wall.  
When installing away from the wall, drainage gradient should be taken into consideration.

- (3) Drill holes at the 4 points indicated on the full-scale diagram.
- (4) Depending on the ceiling type:
  - a) Insert suspension bolts (Fig. 1-11-4-11).
  - or
  - b) Use existing ceiling supports or construct a suitable support (Fig. 1-11-4-12).

Fig. 1-11-4-11

Fig. 1-11-4-12

**WARNING**

It is important that you use extreme care in supporting the indoor unit from the ceiling. Ensure that the ceiling is strong enough to support the weight of the unit. Before suspending the ceiling unit, test the strength of each attached suspension bolt.

- (5) Screw in the suspension bolts, allowing them to protrude from the ceiling (Figs. 1-11-4-11 and 1-11-4-12). The distance of each exposed bolt must be of equal length within 50 mm. (Fig. 1-11-4-13)

**Fig. 1-11-4-13**

- (6) Carry out the preparation for suspending the indoor unit. The suspension method varies depending on whether there is a suspended ceiling or not. (Figs. 1-11-4-14 and 1-11-4-15)
- (7) Suspend the indoor unit as follows:

- a) Install the bracket to the suspension bolt. Stick it onto the ceiling surface. (Figs. 1-11-4-14 and 1-11-4-16)

**Fig. 1-11-4-14**

**Fig. 1-11-4-15**

**Fig. 1-11-4-16**

- b) Suspend the indoor unit to the bracket. Tighten the M8 suspension bolts and fix the indoor unit in place. (Fig. 1-11-4-17)

**Fig. 1-11-4-17**

**NOTE**

The ceiling surface is not always level. Confirm that the indoor unit is evenly suspended. For the installation to be correct, leave a clearance of about 10 mm between the ceiling panel and the ceiling surface and fill the gap with an appropriate insulation or filler material.

- (8) If the tubing and wiring are to go towards the rear of the unit, make holes in the wall. (Fig. 1-11-4-18)
- (9) Measure the thickness of the wall from the inside to the outside and cut PVC pipe at a slight angle to fit. Insert the PVC pipe in the wall. (Fig. 1-11-4-19)

**NOTE**

The hole should be made at a slight downward slant to the outside.

**Fig. 1-11-4-18**

**Fig. 1-11-4-19**

**4-4. Duct for Fresh Air**

There is a outside air intake duct connection port (cut-out hole) at the left-rear of the indoor unit for drawing in fresh air. If it is necessary to draw in fresh air, remove the cover by opening the hole and connecting the duct to the indoor unit through the connection port.

## 4-5. Shaping the Tubing

- The positions of the refrigerant tubing connections are shown in the figure below. (The tubing can be routed in 3 directions.) (Fig. 1-11-4-20)
- \* When routing the tubing out through the top or right sides, cut out the appropriate parts in the top panel and cut notches in the side panel.

Fig. 1-11-4-20

If the tubing is to be routed out together, use a box cutter or similar tool to cut out the part of the rear cover indicated by the marked area (Fig. 1-11-4-21), to match the positions of the tubes. Then draw out the tubing.

Rear cover

Fig. 1-11-4-21

## 4-6. Installing the Drain Pipe

- Prepare standard PVC pipe for the drain and connect it to the indoor unit drain pipe with the supplied hose band to prevent water leaks.
- (1) Drain hose connection
    - The drain hose is connected below the refrigerant tubing.
  - (2) Installing the drain hose
    - First insert the drain hose (supplied) to the hose band (supplied) and then install the drain hose to the unit drain port.
    - Insert until the drain hose bumps to the end.
    - Attach the hose band to make the fixed portion 45° upper slant according to a vinyl tape (not supplied) of the drain hose (supplied).
    - Hose band screw torque is 30 - 35N · cm.
    - Wind the vinyl tape not to blow up the hose band.
    - Connect both the drain hose and PVC pipe (VP20 or similar material, not supplied). Insert until the PVC pipe bumps to the end and adhere with PVC adhesive.

### CAUTION

- **Wrap the drain insulator (supplied) between the connection of the drain hose and tubing not to expose the copper tubing. Also, wrap the hose band together. Wrap the hose band with the drain insulator, where the screw is located facing upward (Fig. 1-11-4-23). Then, tighten the insulator with a vinyl tape not to cause the detachment. If the tubing parts remain exposed, condensation may occur.**
- **Be sure to use the supplied drain hose.**
- If other commercially available hose bands are used, the drain hose may become pinched or wrinkled and there is danger of water leakage. Therefore be sure to use the supplied hose bands.

- Connect the drain pipe so that it slopes downward from the unit to the outside. (Fig. 1-11-4-22)

Fig. 1-11-4-22

- Never allow water traps to occur in the course of the piping.
- Insulate any piping inside the room to prevent dripping.
- After the drain piping, pour an appropriate amount of water into the drain pan through the opening on the side of the air discharge port. Check the water draining smoothly.
- \* If the drain hose is routed through the left side, refer to Fig. 1-11-4-20, and follow the procedure above to install the hose. Reattach the rubber stopper removed earlier onto the right side.

The rubber stopper can be inserted easily by using a screwdriver or similar tool to press the stopper into the drain port on the main unit. Press the stopper into the main unit drain port as far as it will go.

Fig. 1-11-4-23

**CAUTION**

The indoor unit should be slightly tilted downward toward the drain pipe connection side as shown in figure below so that the wastewater can flow smoothly without being trapped in the middle. (Fig. 1-11-4-24)

**Fig. 1-11-4-24**

**4-7. Final Procedure**

Reinstall the removed part to be placed in its original position. (See the section “4-2. Preparation Before Installation”.) Then install the accessory supplied side covers (L/R) on both sides of the indoor unit.

- Attach the supplied side plates.  
Slide the covers from the front side and attach to the claws of the latches.  
Tighten the screws (supplied).

- Attach the accessory supplied side covers.  
Insert the side plates in the direction of the arrow and fix them with 2 screws once you've removed.

**Fig. 1-11-4-25**

- Attach the air-intake grille.  
When attaching the air-intake grille, perform the reverse procedure to removing the grille. Refer to the section “4-2. Preparation Before Installation”. Be sure to attach the safety string.  
Close the air-intake grille and fix the claws of the latches with the screws.

**Fig. 1-11-4-26**

**(Ceiling)**

| Part Name                       | Figure | Q'ty | Remarks   |
|---------------------------------|--------|------|---|
| Special washer                  |        | 4    | For temporarily suspending indoor unit from ceiling |
| Drain insulator                 |        | 2    | For drain hose joint                                |
| Flare insulator                 |        | 1    | For gas tube joint                                  |
|                                 |        | 1    | For liquid tube joints                              |
| Clamper                         |        | 6    | For flare insulator and wiring                      |
| Full-scale installation diagram |        | 1    | For positioning installation                        |
| Drain hose                      |        | 1    | For main unit + PVC pipe joints                     |
| Hose band                       |        | 1    | For drain hose connection                           |
| Side cover (R)                  |        | 1    | (Packed in carton box) For right side               |
| Side cover (L)                  |        | 1    | (Packed in carton box) For left side                |

## 5. Wall Mounted Type (K1)

### ■ SELECTING THE INSTALLATION SITE

#### Indoor Unit

##### AVOID:

- areas where leakage of flammable gas may be expected.
- places where large amounts of oil mist exist.
- direct sunlight.
- locations near heat sources which may affect the performance of the unit.
- locations where external air may enter the room directly. This may cause "condensation" on the air discharge ports, causing them to spray or drip water.
- locations where the remote controller will be splashed with water or affected by dampness or humidity.
- installing the remote controller behind curtains or furniture.
- locations where high-frequency emissions are generated.

##### DO:

- select an appropriate position from which every corner of the room can be uniformly cooled.
- select a location where the ceiling is strong enough to support the weight of the unit.
- select a location where tubing and drain pipe have the shortest run to the outdoor unit.
- allow room for operation and maintenance as well as unrestricted air flow around the unit.
- install the unit within the maximum elevation difference above or below the outdoor unit and within a total tubing length (L) from the outdoor unit as detailed in the Installation Instructions provided with the outdoor unit.
- allow room for mounting the remote controller about 1 m off the floor, in an area that is not in direct sunlight or in the flow of cool air from the indoor unit.

## ■ HOW TO INSTALL THE INDOOR UNIT

### ■ Wall Mounted Type (Type K1)

#### Remove the Rear Panel from the Unit

- (1) Remove and discard the set screw on the rear panel. (Fig. 1-11-5-1)
- (2) Press the 2 △ marks on the frame cover and disengage the stationary tabs from the frame. (Fig. 1-11-5-2)
- (3) Remove the rear panel by grasping the sections shown in Fig. 1-11-5-3 and pulling it in the direction shown by the arrow.

Set screw only for transportation

Fig. 1-11-5-1

#### NOTE

Tubing can be extended in 6 directions as shown in Fig. 1-11-5-5. Select the direction you need providing the shortest run to the outside unit.

- When left tubing is to be done, switch the drain hose and drain cap. (For details, refer to “Switching drain hose and drain cap”.)

#### Make a Hole

- (1) Place the rear panel from the indoor unit on the wall at the location selected. Make sure the panel is horizontal, using a carpenter’s level or tape measure to measure down from the ceiling. Wait until after cutting the hole before attaching the rear panel to the wall.
- (2) Determine which side of the unit you should make the hole for tubing and wiring. (Fig. 1-11-5-6)

Fig. 1-11-5-2

#### NOTE

In the case of left-rear tubing, use the measurement points 158 mm from the marked position on the rear panel for precise placement of the hose outlet. (Fig. 1-11-5-6)

- (3) Before making the hole, check carefully that no studs or pipes are directly run behind the spot to be cut.

Fig. 1-11-5-3

#### CAUTION

Also avoid areas where electrical wiring or conduits are located.

The above precautions are also applicable if tubing goes through the wall in any other location.

Fig. 1-11-5-4

Fig. 1-11-5-6

Fig. 1-11-5-5

- (4) Using a sabre saw, keyhole saw or hole-cutting drill attachment, cut a hole in the wall. See Table 1-11-5-1 and Fig. 1-11-5-7.

**Table 1-11-5-1**

| Hole Dia. |
|-----------|
| 80 mm     |

- (5) Measure the thickness of the wall from the inside edge to the outside edge and cut PVC pipe at a slight angle 6 mm shorter than the thickness of the wall. (Fig. 1-11-5-8)
- (6) Place the plastic cover over the end of the pipe (for indoor side only) and insert the pipe in the wall. (Fig. 1-11-5-9)

### Install the Rear Panel on the Wall

Be sure to confirm that the wall is strong enough to suspend the unit.

There are a number of screw holes on the rear panel.

Using the 8 screw holes with ↔ mark is recommended to attach the rear panel securely to the wall.

#### NOTE

Be sure to install the unit within the range of the wall.

#### If Wooden Wall

- (1) Attach the rear panel to the wall with the 8 screws provided. (Fig. 1-11-5-10)
- If you are not able to line up the holes in the rear panel with the beam locations marked on the wall, use rawl plugs or toggle bolts to go through the holes on the panel or drill 5 mm dia. holes in the panel over the stud locations and then mount the rear panel.
- (2) Double check with a carpenter's level or tape measure that the panel is level. This is important to install the unit properly. (Fig. 1-11-5-11)
- (3) Make sure the panel is flush against the wall. Any space between the wall and unit will cause noise and vibration.

#### NOTE

Hole should be made at a slight downward slant to the outdoor side.

**Fig. 1-11-5-7**

PVC pipe (Locally purchased)

Cut at slight angle

**Fig. 1-11-5-8**

**Fig. 1-11-5-9**

**Fig. 1-11-5-10**

**Fig. 1-11-5-11**

## Removing and Installing the Grille

Basically, these models can be installed and wired without removing the grille. If access to any internal part is needed, follow the steps as given below.

### How to remove the grille

- (1) Open the front panel until it is nearly horizontal, grasp the sections near the front panel arms on both sides, and then remove the panel by pushing the arms towards the outside while pulling the panel towards you.  
If the front panel is difficult to remove, grasp both ends of it and lift it up slightly. Move it to the left and disengage the left arm, then move it to the right and disengage the right arm. (Fig. 1-11-5-12)
- (2) Lift the anti-mold filter up slightly to disengage it from the protrusions on the unit, and then pull downward to remove the filter from the unit. (Fig. 1-11-5-12)
- (3) Remove the 3 screws from the front of the unit and remove the screw covers on the bottom surface. Then remove the 2 screws. (Fig. 1-11-5-13)
- (4) Remove the screw on the right side cover plate and remove the cover. (Fig. 1-11-5-13)
- (5) Remove the lower flap by disengaging 4 pins of the lower flap in order. (Figs. 1-11-5-14 and 1-11-5-15)  
(The flap is so flexible that it can be easily removed.)
- (6) Lift up the grille in the direction shown by the arrow and pull the grille towards you to remove it. (Fig. 1-11-5-16)

### How to replace the grille

- (1) While aligning the top edge of the grille with the frame, move the grille horizontally and insert the top and bottom into the frame.
- (2) Press the grille firmly with your hand to ensure no gap exists between the frame and grille.
- (3) Tighten the 6 screws. And fix the removed covers in place.
- (4) Grasp the sections near the front panel arms on both sides, and hold the front panel so that it is nearly horizontal. Push the arm shafts towards the outside so that they come into contact with the top of the indentations on the right and left sides of the air conditioner. Then push firmly until the arm shafts click into place. (Fig. 1-11-5-17)
- (5) Remount the lower flap.  
(In remounting the flap, it cannot be turned end for end because the right and left pins of the flap differ in form. (Fig. 1-11-5-15))
- (6) Insert the top of the anti-mold filter, and then secure the bottom of the filter with the protrusions on the unit.
- (7) When closing the front panel, push the central part of the front panel first and then press the bottom right and left corners in place until you feel a click. (Fig. 1-11-5-18)

**NOTE**

Check that no gap exists between the frame and the grille.

Fig. 1-11-5-12

Fig. 1-11-5-13

Fig. 1-11-5-14

Fig. 1-11-5-15

Fig. 1-11-5-16

Fig. 1-11-5-17

Fig. 1-11-5-18

## Shape the Indoor Side Tubing

- (1) Arrangement of tubing by direction
  - a) Right or left tubing
 

Cut out the corner of the right/left frame with a hacksaw or the like. (Figs. 1-11-5-19 and 1-11-5-20)
  - b) Right-rear or left-rear tubing
 

In this case, the corner of the frame need not be cut.
- (2) To mount the indoor unit on the rear panel:
 

Hang the 3 mounting slots of the unit on the upper tabs of the rear panel. (Fig. 1-11-5-21)

## Wiring Instructions

### General precautions on wiring

- (1) Before wiring, confirm the rated voltage of the unit as shown on its nameplate, then carry out the wiring closely following the wiring diagram.
- (2) Provide a power outlet to be used exclusively for each unit, with a power supply disconnect and circuit breaker for overcurrent protection provided in the exclusive line.
- (3) To prevent possible hazards due to insulation failure, the unit must be grounded.
- (4) Each wiring connection must be done tightly and in accordance with the wiring system diagram. Wrong wiring may cause the unit to misoperate or become damaged.
- (5) Do not allow wiring to touch the refrigerant tubing, compressor, or any moving parts of the fan.
- (6) Unauthorized changes in the internal wiring can be very dangerous. The manufacturer will accept no responsibility for any damage or misoperation that occurs as a result of such unauthorized changes.

Fig. 1-11-5-19

Fig. 1-11-5-20

Fig. 1-11-5-21

**Mounting**

- (1) To install the indoor unit, mount the indoor unit onto the 3 tabs on the upper part of the rear plate.
- (2) Hold down the air discharge outlet and press the lower part of the indoor unit until it clicks to securely fasten to the 2 tabs on the lower part of the rear plate. (Fig. 1-11-5-22)

**NOTE**

For tubing, choose either the right or left tubing direction and follow the steps below. Also, extend the support on the back of the indoor unit as a stand to make your work easier. (Fig. 1-11-5-23)

**Fig. 1-11-5-22**

**Right-side tubing**

- (1) Shape the refrigerant tubing so that it can easily go into the wall hole. (Fig. 1-11-5-24)
- (2) Push the wiring, refrigerant tubing, and drain hose through the hole in the wall. Adjust the indoor unit so it is securely seated on the rear panel. (Fig. 1-11-5-25)
- (3) Carefully bend the tubing (if necessary) to run along the wall in the direction of the outdoor unit and then tape as far as the fittings. The drain hose should come straight down the wall to a point where water runoff won't stain the wall.
- (4) Connect the refrigerant tubing to the outdoor unit. (After performing a leak test on the connecting part, insulate with the tubing insulation. (Fig. 1-11-5-26)).
- (5) Assemble the refrigerant tubing, drain hose, and conduit (including inter-unit wiring) as shown in Fig. 1-11-5-27.

**Fig. 1-11-5-23**

**Fig. 1-11-5-26**

**Fig. 1-11-5-27**

**Fig. 1-11-5-24**

**Fig. 1-11-5-25**

## ■ Left-side tubing

- (1) Lead the tubing and drain hose through the wall, allowing sufficient length for connection. Then bend the tubing using a tube bender to make the attachment. (Fig. 1-11-5-28)
- (2) Switch the drain hose and drain cap.

### Switching drain hose and drain cap

- (a) Locate the drain hose and the drain cap. (Fig. 1-11-5-29)
- (b) Remove the screw fastening the drain hose on the right side, and pull out the drain hose to remove it. (Fig. 1-11-5-29)
- (c) Apply moderate force to pull off the drain cap on the left side. (If you cannot pull it off by hand, use a long-nose pliers.)
- (d) Reattach the drain hose to the left side and the drain cap to the right side. (Fig. 1-11-5-30)

### Drain hose

Slide the drain hose fully onto the drain pan outlet. (It will be easy to slide when water is added.) Check that the screw holes in the drain bracket and the drain pan outlet are aligned and securely in contact, then fasten them with the screw. (After attaching the drain hose, check that it is attached securely.) (Fig. 1-11-5-31)

### Drain cap

Use a Phillips head screwdriver to push the drain cap in firmly. (If it is difficult to push in, wet the cap with water first.)

- (3) Install the indoor unit on the rear panel.
- (4) Connect the tubing and wiring led inside from outdoors.
- (5) After completing a leak test, bundle the tubing together with armoring tape and store it inside the tubing storage area at the back of the indoor unit and hold it with clamps. (Figs. 1-11-5-30 and 1-11-5-32)

Fig. 1-11-5-28

Fig. 1-11-5-29

Fig. 1-11-5-30

Fig. 1-11-5-31

Fig. 1-11-5-32

**To unmount indoor unit**

- (1) Remove the screw cover on the bottom surface.  
(Fig. 1-11-5-34)
- (2) Fasten the frame to the rear panel using the 2 supplied tapping screws 4 × 10 mm. (Fig. 1-11-5-34)
- (3) Press the 2 △ marks on the lower part of the indoor unit and unlatch the tabs. Then lift the indoor unit and unmount.  
(Fig. 1-11-5-33)

**Fig. 1-11-5-33**

**NOTE**

Under normal conditions, the installation design calls for a less than 2 mm gap between the air conditioner unit and the wall. Confirm that the gap is appropriate (less than 2 mm).

**Drain Hose**

- a) The drain hose should be slanted downward to the outdoors. (Fig. 1-11-5-35)
  - b) Never form a trap in the course of the hose.
  - c) If the drain hose will run in the room, insulate the hose with insulation\* so that chilled condensation will not damage furniture or floors. (Fig. 1-11-5-36)
- \*Foamed polyethylene or its equivalent is recommended.

**WARNING**

**Do not supply power to the unit or operate it until all tubing and wiring to the outside unit are completed.**

**Risk of Electric Shock**

**Fig. 1-11-5-34**

**Fig. 1-11-5-35**

**Fig. 1-11-5-36**

## (Wall Mounted)

| Part Name        | Figure  | Q'ty |
|------------------|---|------|
| Tapping screw    | Truss-head<br>Phillips <br>4 x 20 mm | 8    |
| Tapping screw    | Truss-head<br>Phillips <br>4 x 10 mm | 2    |
| Flare insulation |                                      | 1    |

## 6. Low Silhouette Ducted Type (F1)

### ■ SELECTING THE INSTALLATION SITE

#### Indoor Unit

##### AVOID:

- areas where leakage of flammable gas may be expected.
- places where large amounts of oil mist exist.
- direct sunlight.
- locations near heat sources which may affect the performance of the unit.
- locations where external air may enter the room directly. This may cause “condensation” on the air discharge ports, causing them to spray or drip water.
- locations where the remote controller will be splashed with water or affected by dampness or humidity.
- installing the remote controller behind curtains or furniture.
- locations where high-frequency emissions are generated.

##### DO:

- select an appropriate position from which every corner of the room can be uniformly cooled.
- select a location where the ceiling is strong enough to support the weight of the unit.
- select a location where tubing and drain pipe have the shortest run to the outdoor unit.
- allow room for operation and maintenance as well as unrestricted air flow around the unit.
- install the unit within the maximum elevation difference above or below the outdoor unit and within a total tubing length (L) from the outdoor unit as detailed in the Installation Instructions provided with the outdoor unit.
- allow room for mounting the remote controller about 1m off the floor, in an area that is not in direct sunlight or in the flow of cool air from the indoor unit.

■ HOW TO INSTALL THE INDOOR UNIT

■ Low Silhouette Ducted Type (Type F1)

6-1. Required Minimum Space for Installation and Service

- This air conditioner is usually installed above the ceiling so that the indoor unit and ducts are not visible. Only the air intake and air outlet ports are visible from the unit bottom.
- The minimum space for installation and service is shown in Fig. 1-11-6-1 and Table 1-11-6-1.

Table 1-11-6-1 Unit: mm

| Type       | 36, 45, 50 | 60, 71 | 100, 125, 140 |
|------------|------------|--------|---------------|
| A (Length) | 867        | 1,067  | 1,467         |

- It is recommended that space be provided (450 × 450 mm) for checking and servicing the electrical system.
- The detailed dimensions of the indoor unit is shown in Fig. 1-11-6-2 and Table 1-11-6-2.

Table 1-11-6-2 Unit: mm

| Type          | A     | B     | C                     | D  | E     | F  |
|---------------|-------|-------|-----------------------|----|-------|----|
| 36, 45, 50    | 867   | 800   | 450 (Pitch 150 × 3)   | 71 | 592   | 12 |
| 60, 71        | 1,067 | 1,000 | 750 (Pitch 150 × 5)   | 21 | 792   | 16 |
| 100, 125, 140 | 1,467 | 1,400 | 1,050 (Pitch 150 × 7) | 71 | 1,192 | 20 |

Fig. 1-11-6-1

Unit: mm

Fig. 1-11-6-2

## 6-2. Suspending the Indoor Unit

Depending on the ceiling type:

- Insert suspension bolts (Fig. 1-11-6-3) or
- Use existing ceiling supports or construct a suitable support (Fig. 1-11-6-4).

Fig. 1-11-6-3

Fig. 1-11-6-4

Fig. 1-11-6-5

Fig. 1-11-6-6

### WARNING

It is important that you use extreme care in supporting the indoor unit inside the ceiling. Ensure that the ceiling is strong enough to support the weight of the unit. Before suspending the unit, test the strength of each attached suspension bolt.

- (1) When placing the unit inside the ceiling, determine the pitch of the suspension bolts referring to the dimensional data as shown in Fig. 1-11-6-1 and Table 1-11-6-2. Tubing must be laid and connected inside the ceiling when suspending the unit. If the ceiling is already constructed, lay the tubing into position for connection to the unit before placing the unit inside the ceiling.
- (2) Screw in the suspension bolts allowing them to protrude from the ceiling (Fig. 1-11-6-3). (Cut the ceiling material, if necessary.)
- (3) Thread the 3 hexagonal nuts and 2 washers (field supply) onto each of the 4 suspension bolts (Figs. 1-11-6-5 and 1-11-6-6). Use 1 nut and 1 washer for the upper part, and 2 nuts and 1 washer for the lower part, so that the unit will not fall off the suspension lugs.

- This shows an example of installation.

Fig. 1-11-6-7

### 6-3. Installing the Drain Pipe

- Prepare standard hard PVC pipe (O.D. 32 mm) for the drain and use the supplied hose band to prevent water leaks.  
The PVC pipe must be purchased separately.  
The transparent drain part on the unit allows you to check drainage. (Fig. 1-11-6-8)

#### CAUTION

- Do not use adhesive tape at the drain connection port on the indoor unit.
- Insert the drain pipe until it contacts the socket, and then secure it tightly with the hose band.
- Do not use the supplied drain hose bent at a 90° angle. (The maximum permissible bend is 45°.)
- Tighten the hose clamps so their locking nuts face upward. (Fig. 1-11-6-8)

Align the hose band with end of the hose, and tighten so that it does not contact the bead.

Fig. 1-11-6-8

- After connecting the drain pipe securely, wrap the supplied packing and drain pipe insulator around the pipe, then secure it with the vinyl clamps. (Fig. 1-11-6-9)

Fig. 1-11-6-9

#### NOTE

Make sure the drain pipe has a downward slant (1/100 or more) and that there are no water traps.

#### CAUTION

- Do not install an air bleeder as this may cause water to spray from the drain pipe outlet. (Fig. 1-11-6-10)

Fig. 1-11-6-10

- If it is necessary to increase the height of the drain pipe, the section directly after the connection port can be raised a maximum of 500 mm. Do not raise it any higher than 500 mm, as this could result in water leaks. (Fig. 1-11-6-11)

Fig. 1-11-6-11

- Do not install the pipe with an upward slant from the connection port. This will cause the drain water to flow backward and leak when the unit is not operating. (Fig. 1-11-6-12)

Fig. 1-11-6-12

- Do not apply force to the piping on the unit side when connecting the drain pipe. The pipe should not be allowed to hang unsupported from its connection to the unit. Fasten the pipe to a wall, frame, or other support as close to the unit as possible. (Fig. 1-11-6-13)

Fig. 1-11-6-13

### Checking the Drainage

After wiring and drain piping are completed, use the following procedure to check that the water will drain smoothly. For this, prepare a bucket and wiping cloth to catch and wipe up spilled water.

- Connect power to the power terminal board (R, S terminals) inside the electrical component box.
- Remove the tube cover and slowly pour about 1,200 cc of water through the opening into the drain pan to check drainage.
- Short-circuit the check pin (CHK) on the indoor control circuit board and operate the drain pump. Check the water flow through the transparent drain port and see if there is any leakage.

#### CAUTION

Be careful since the fan will start when you short the pin on the indoor control board.

- When the drainage check is complete, open the check pin (CHK) and remount the insulator and drain cap onto the drain inspection port.

Fig. 1-11-6-14

### 6-4. Connecting Duct to Air Intake Port Side

- (1) First pull out a filter in the direction of the electrical component box in the unit. (Fig. 1-11-6-15)  
The pre-installed filter will not be used any more.
- (2) Then remove the seal packing, bracket and filter attached to the side of the air intake port. (Fig. 1-11-6-15)
- (3) Install the duct (field supply).  
See the figure for the dimension of the installation hole.  
Use M5 self-tapping screws for installation. (Fig. 1-11-6-16)

Fig. 1-11-6-15

**NOTE**

- Select an air-intake grille with a filter at a local shop.
- To get clean air and to extend the service life of the air conditioner, an air filter must be installed in the air intake.  
For installation and cleaning the air filter, consult your dealer or service center.

Unit : mm

| Type          | G                        | H  | J   | K  |
|---------------|--------------------------|----|-----|----|
| 36, 45, 50    | 600<br>(Pitch 150 × 4)   | 25 | 113 | 14 |
| 60, 71        | 900<br>(Pitch 150 × 6)   | 25 | 13  | 18 |
| 100, 125, 140 | 1,350<br>(Pitch 150 × 9) | 0  | 13  | 24 |

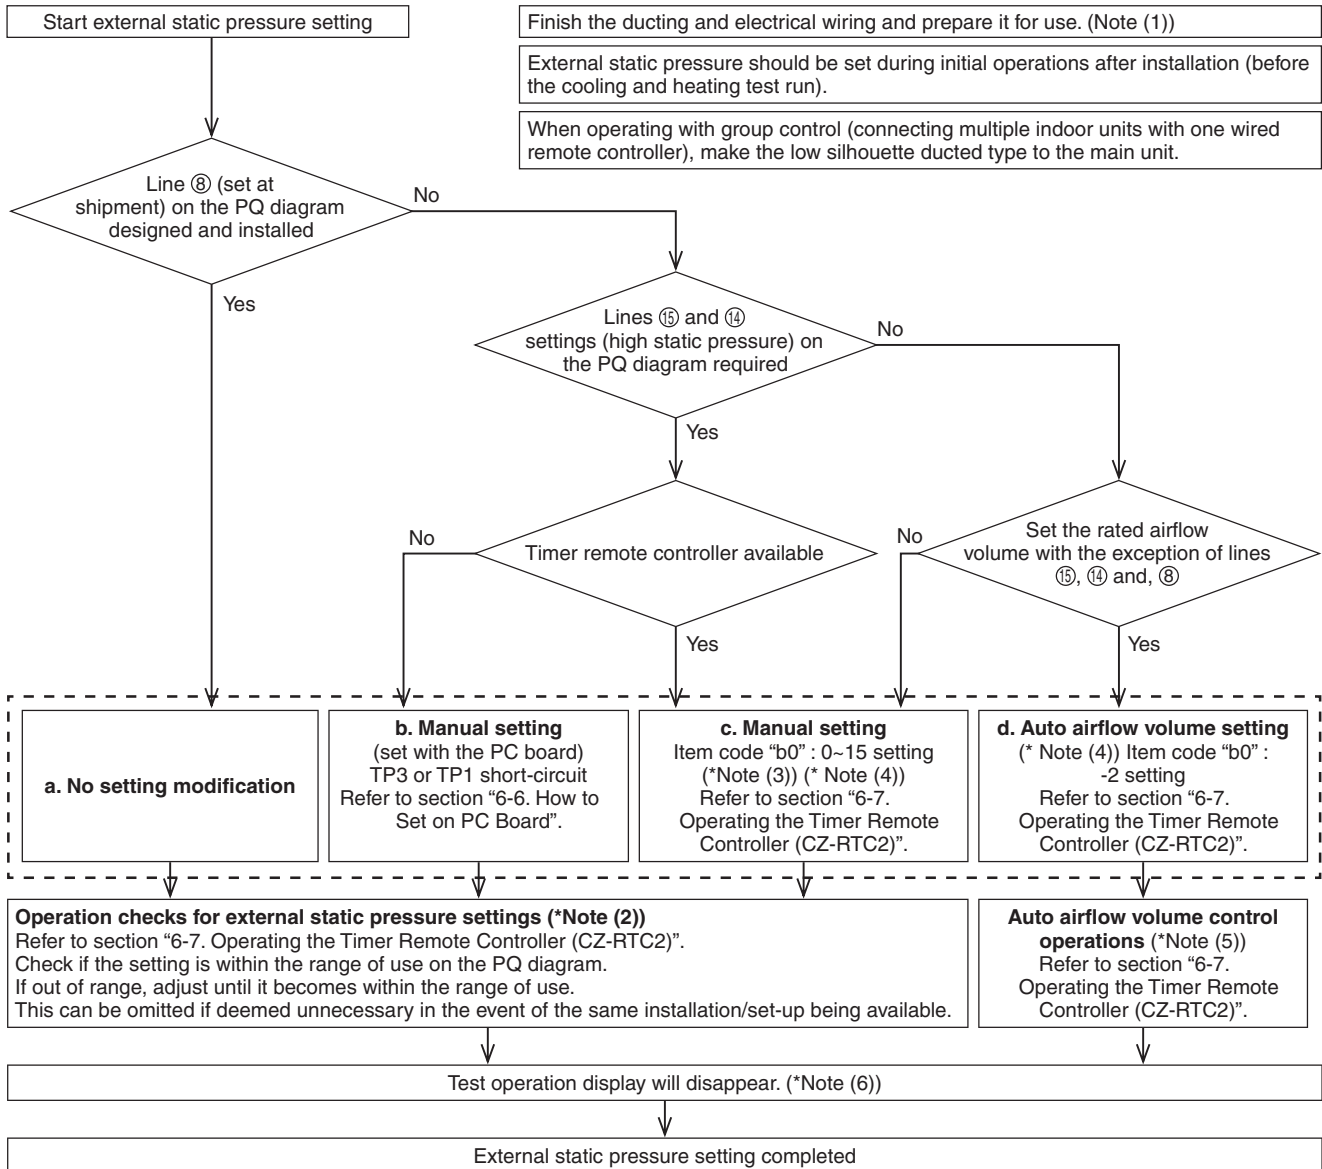

Fig. 1-11-6-16

## 6-5. External Static Pressure Setting

Choose one of the following methods from “a”, “b”, “c” or “d” as shown in the flow chart (within the dotted lines) and then make the setting accordingly.

- a. No setting modification.....: Use-as-is at shipment (there are cases in which the setting may differ from the shipment setting when reset after once setting the external static pressure.)
- b. Manual setting (set with the PC board).....: For high static pressure. Switching method with the short-circuit connector.
- c. Manual setting (set with the wired remote controller) .....: Low static pressure ~ high static pressure
- d. Auto airflow volume setting (set on the wired remote controller) ....: Air outlet volume is automatically adjusted to the rated airflow volume with the auto airflow control drive.

### Flow of External Static Pressure

### NOTE

- (1) Check the following items before performing the setting-check operations or auto airflow volume operations.
- 1) Check to make sure that the electrical wiring and ducting have been completed. Activate the stand-by mode. In particular, make sure that the closed damper located in the middle of the duct is open, if installed. Also, make sure that air filters have been installed inside the air inlet duct.  
Check to make sure air is not leaking from the joints.
  - 2) If multiple air outlets and air inlets are included, adjust the airflow volume ratio of all of them until they meet the design airflow ratio.
  - 3) Make sure the address setting has been completed.
- (2) The operation check will be completed in approximately three minutes if the settings have been made correctly. The settings will be modified if they are out of the range of use (maximum 30 minutes.). If this is not completed within 31 minutes, check whether the air speed is set to “H” or not.

- (3) Refer to Table 1-11-6-4 and Fig. 1-11-6-18 for details on the relationship between the value of item code “b0” and the external static pressure.
- (4) When set in group control (connecting multiple indoor units with one wired remote controller), set each indoor unit to item code “b0”. When amending the setting after selecting [ b. Manual setting] (due to airflow path changes, etc.), it is necessary to cancel [b. Manual setting] (disconnect short-circuit connector). When [b. Manual setting] has not been cancelled, [c. Manual setting] and [d. Auto airflow volume setting] will be activated if selected, but [b Manual setting] takes precedence when the power is switched back on after power outages, etc.
- (5) If this is not completed within 8 minutes, check the drive mode, air speed and air inlet temperature.
- (6) When set in group control (connecting multiple indoor units with one wired remote controller), the test run operations display will disappear once the external static pressure setting check or auto airflow volume control operation check have been completed for the main unit. Decisions on sub-unit complete are not possible. The test run operation display will disappear after one hour even if the external static pressure setting check or auto airflow volume control operation check have not been completed.

**CAUTION**

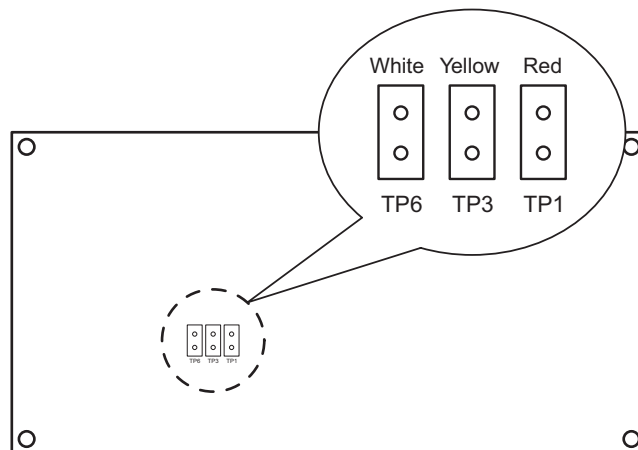

- Be sure to check that the external static pressure is within the range for use and then make the setting. Failure to observe this may result in insufficient airflow or water leakages. Refer to Fig. 1-11-6-18 for the external static pressure setting range.
- There are cases in which automatic variable dampers and other mounted items may trigger the P12 alarm on systems that modify the external static pressure when the auto airflow volume control operations or setting check operations are carried out if high external static pressure is lowered. In this event, lower the dampers, etc., so that the external static pressure reaches its lowest level, and then carry out the auto airflow volume control operations or setting check operations.
- Be sure to set the [External Static Pressure Setting] once again after amending the airflow path for the duct or air outlet after setting the external static pressure.
- Set the air inlet temperature within the range for use. The auto airflow volume control will not function if the air inlet temperature is over 45°C or not in the fan mode.

**6-6. How to Set on PC Board**

1. Turn off the power breaker to halt the supply of electricity to the PC board.
2. Open the lid of electrical component box and check where the short-circuit pin on the indoor unit control PC board is located (Fig. 1-11-6-17)
3. Short circuit the applicable short-circuit pin in accordance with the selected short-circuit pin connected (Fig. 1-11-6-18).  
 150 Pa : TP3 (2P: yellow) short-circuit  
 140 Pa : TP1 (2P: red) short-circuit  
 \* Use the short-circuit connector (2P: yellow) supplied.

**Table 1-11-6-3 Selection of connected short-circuit pins**

| External static pressure at the time of rated airflow volume | Short-circuit pin |
|--|-------------------|
| Unusable   | TP6 (2P: white)   |
| 150 Pa   | TP3 (2P: yellow)  |
| 140 Pa   | TP1 (2P: red)     |

Indoor Unit control PC board

**Fig. 1-11-6-17**

## 6-7. Operating the Timer Remote Controller (CZ-RTC2)

Setting Item Code “**b0**”

- Press and hold down the , and buttons simultaneously for 4 or more seconds.  
( **SETTING**, the Unit No., Item Code and Detailed Data will blink on the remote controller's LCD display.)
- The indoor unit numbers in the group control will be sequentially displayed whenever the Unit Select button is pressed .  
Only the fan motor for the selected indoor unit will operate during this.
- Specify the “**b0**” item code by pressing the / buttons for the temperature setting buttons and confirm the values.  
(“**-001**” set at shipment )
- Press the / buttons for the time to amend the values for the set data.  
Refer to table 1-11-6-2 and Fig.1-11-6-4 and select a value between “**0001**” and “**0015**”.  
Select “**-002**” if the auto airflow volume setting is activated.
- Press the button.  
The display will stop blinking and remain illuminated.
- Press the button. The fan motor will stop operating and the LCD display will return to the normal stop mode.

### Auto Airflow Volume Control Operations and External Static Pressure Setting-Check Operation

- Press and hold down the button for 4 or more seconds. “**TEST**” will be displayed on the remote controller's LCD display.
- Press the button to commence the test run.  
[Test Run] will be displayed on the remote controller's LCD display.
- Select the fan mode and set it to “H” by pressing the button.

### CAUTION

Auto airflow volume control operations and external static pressure setting-check operations will not be performed unless [H] has been selected for the fan mode.

- The fan motor will be activated and auto airflow volume control operations or external static pressure setting-check operations will commence.  
The power of the airflow will change while these operations are in progress.  
The external static pressure setting-check operations and auto airflow volume control operations will be completed in about 3 to 30 minutes.  
The “**TEST**” display will be extinguished from the remote controller's LCD display.
- Press the button to halt the test run.

Table 1-11-6-4 Setting the external static pressure

| Indoor unit  |               | Item code   |
|--|---------------|-------------|
| 36, 45, 50, 60, 71   | 100, 125, 140 | b0          |
| External static pressure of the rated air flow volume (Pa) |               |             |
| 150  | 150           | <b>0015</b> |
| 140  | 140           | <b>0014</b> |
| 130  | 130           | <b>0013</b> |
| 120  | 120           | <b>0012</b> |
| 100  | 110           | <b>0011</b> |
| 70   | 100           | <b>0008</b> |
| 60   | 70            | <b>0006</b> |
| 50   | 50            | <b>0005</b> |
| 30   | 30            | <b>0003</b> |
| 10   | 10            | <b>0001</b> |
| No auto airflow volume setting                             |               | <b>-001</b> |
| Auto airflow volume setting                                |               | <b>-002</b> |

\* Failure to set this parameter may result in decreased airflow and condensation.

Indoor Fan Performance

|     |   | Item code "b0" |         |         |         |         |         |         |         |         |         |         |         |   |   |   |

- Use M10 for suspension bolts.
- Suspension bolts and nuts are field supply.

## ■ Optional Duct Frange

### How to Install Duct Frange

- 4 circle duct frange (CZ-160DAF2)
- 3 circle duct frange (CZ-90DAF2)
- 2 circle duct frange (CZ-56DAF2)

1. Remove the air outlet duct frange.

2. Attach the duct frange to the side of the unit with the supplied screws.

**Dimensional Diagram : CZ-56DAF2**

unit: mm

**Dimensional Diagram : CZ-90DAF2**

unit: mm

**Dimensional Diagram : CZ-160DAF2**

unit: mm

## 7. Ducted Type (N1)

### ■ SELECTING THE INSTALLATION SITE

#### Indoor Unit

##### AVOID:

- areas where leakage of flammable gas may be expected.
- places where large amounts of oil mist exist.
- direct sunlight.
- locations near heat sources which may affect the performance of the unit.
- locations where external air may enter the room directly. This may cause “condensation” on the air discharge ports, causing them to spray or drip water.
- locations where the remote controller will be splashed with water or affected by dampness or humidity.
- installing the remote controller behind curtains or furniture.
- locations where high-frequency emissions are generated.

##### DO:

- select an appropriate position from which every corner of the room can be uniformly cooled.
- select a location where the ceiling is strong enough to support the weight of the unit.
- select a location where tubing and drain pipe have the shortest run to the outdoor unit.
- allow room for operation and maintenance as well as unrestricted air flow around the unit.
- install the unit within the maximum elevation difference above or below the outdoor unit and within a total tubing length (L) from the outdoor unit as detailed in the Installation Instructions provided with the outdoor unit.
- allow room for mounting the remote controller about 1 m off the floor, in an area that is not in direct sunlight or in the flow of cool air from the indoor unit.

■ SELECTING THE LOCATION FOR THE INDOOR UNIT

7-1. Required Minimum Space for Installation and Service

Provide a check port on the piping side ceiling for repair and maintenance.

Install the indoor unit once the following conditions are satisfied and after receiving the customer approval.

1. The indoor unit must be within a maintenance space.
2. The indoor unit must be free from any obstacles in path of the air inlet and outlet, and must allow spreading of air throughout the room.

If the height from the floor to ceiling exceeds three meters, air flow distribution deteriorates and the effect is decreased.

Fig. 1-11-7-1

POSITION OF SUSPENSION BOLT

- Apply a joint-canvas between the unit and duct to absorb unnecessary vibration.
- Install the unit leaning to a drainage hole side as a figure for easy water drainage.

Table 1-11-7-1

Unit: mm

| TYPE        | A    | B    | C   | D  | E   |
|-------------|------|------|-----|----|-----|

## 7-2. Suspending the Indoor Unit

Depending on the ceiling type:

- Insert suspension bolts (Fig. 1-11-7-3)  
or
- Use existing ceiling supports or construct a suitable support (Fig. 1-11-7-4).

Fig. 1-11-7-3

Fig. 1-11-7-4

### WARNING

It is important that you use extreme care in supporting the indoor unit inside the ceiling.

Ensure that the ceiling is strong enough to support the weight of the unit.

Before suspending the unit, test the strength of each attached suspension bolt.

- (1) When placing the unit inside the ceiling, determine the pitch of the suspension bolts referring to the dimensional data as shown in Fig. 1-11-7-1 and Table 1-11-7-1.  
Tubing must be laid and connected inside the ceiling when suspending the unit.  
If the ceiling is already constructed, lay the tubing into position for connection to the unit before placing the unit inside the ceiling.
- (2) Screw in the suspension bolts allowing them to protrude from the ceiling (Fig. 1-11-7-3). (Cut the ceiling material, if necessary.)
- (3) Thread the 3 hexagonal nuts and 2 washers (field supply) onto each of the 4 suspension bolts (Figs. 1-11-7-5 and 1-11-7-6).  
Use 1 nut and 1 washer for the upper part, and 2 nuts and 1 washer for the lower part, so that the unit will not fall off the suspension lugs.

Fig. 1-11-7-5

Fig. 1-11-7-6

- This shows an example of installation.

Fig. 1-11-7-7

### 7-3. Installing the Drain Pipe

(1) Prepare standard hard PVC pipe (O.D. 32 mm) for the drain and use the supplied hose band to prevent water leaks. The PVC pipe must be purchased separately.

**CAUTION**

- Do not use adhesive tape at the drain connection port on the indoor unit
- Insert the drain pipe until it contacts the socket, and then secure it tightly with the hose band.
- Do not use the supplied drain hose bent at a 90° angle. (The maximum permissible bend is 45°.)
- Tighten the hose clamps so their locking nuts face upward. (Fig. 1-11-7-8)

Fig. 1-11-7-8

(2) After connecting the drain pipe securely, wrap the supplied packing and drain pipe insulator around the pipe, then secure it with the vinyl clamps. (Fig. 1-11-7-9)

Fig. 1-11-7-9

**NOTE**

Make sure the drain pipe has a downward slant (1/100 or more) and that there are no water traps.

**CAUTION**

- Do not install an air bleeder as this may cause water to spray from the drain pipe outlet. ( Fig. 1-11-7-10)

Fig. 1-11-7-10

Fig. 1-11-7-11

- Do not install the pipe with an upward slant from the connection port. This will cause the drain water to flow backward and leak when the unit is not operating. (Fig. 1-11-7-12)

Fig. 1-11-7-12

- Do not apply force to the piping on the unit side when connecting the drain pipe. The pipe should not be allowed to hang unsupported from its connection to the unit. Fasten the pipe to a wall, frame, or other support as close to the unit as possible. (Fig. 1-11-7-13)

Fig. 1-11-7-13

### 7-4. Connecting Duct to Indoor Unit

(1) Install the duct (local supply) for the Dimension of the installation hole. Use M5 self-tapping screws for installation. See the Outside Dimensions.

(2) The duct connection of the air outlet needs thermal insulation.

Fig. 1-11-7-14

**NOTE**

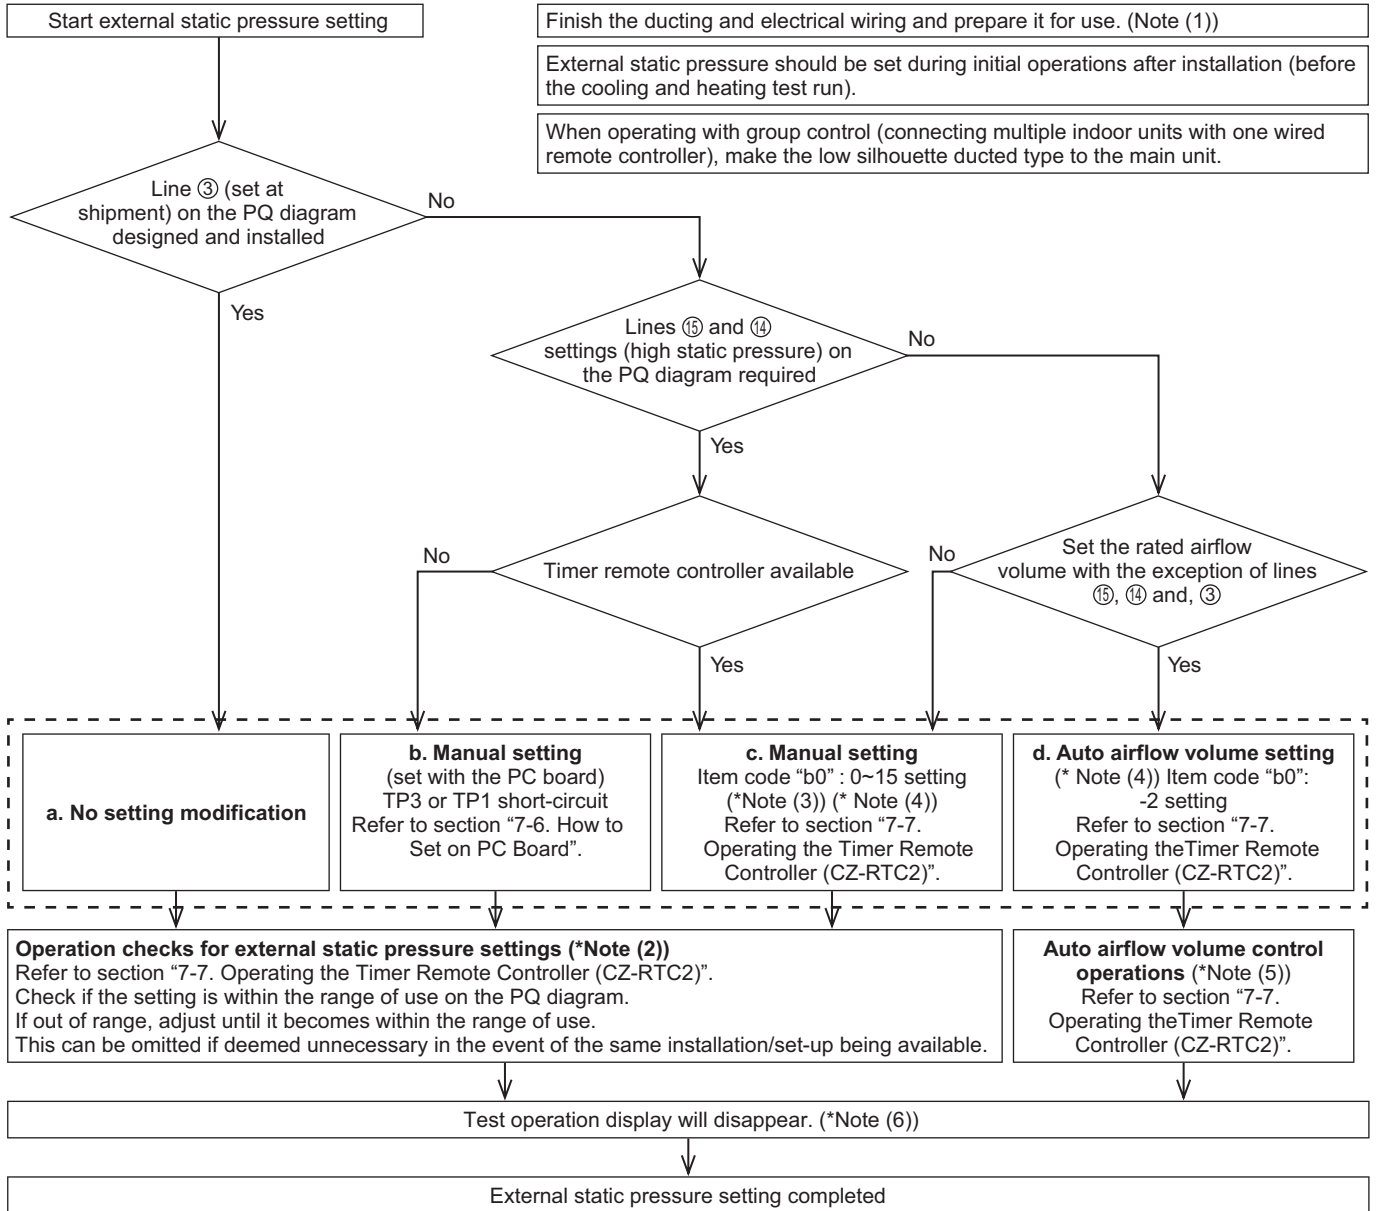

- Select an air-intake grille with a filter at a local shop.
- To get clean air and to extend the service life of the air conditioner, an air filter must be installed in the air intake. For installation and cleaning the air filter, consult your dealer or service center.

### 7-5. External Static Pressure Setting for Dc Fan Motor Model

Choose one of the following methods from “a”, “b”, “c” or “d” as shown in the flow chart (within the dotted lines) and then make the setting accordingly.

- a. No setting modification..... : Use-as-is at shipment (there are cases in which the setting may differ from the shipment setting when reset after once setting the external static pressure.)
- b. Manual setting (set with the PC board)..... : For high static pressure. Switching method with the short-circuit connector.
- c. Manual setting (set with the wired remote controller) ..... : Low static pressure ~ high static pressure
- d. Auto airflow volume setting (set on the wired remote controller).... : Air outlet volume is automatically adjusted to the rated airflow volume with the auto airflow control drive.

#### Flow of External Static Pressure

**NOTE**

- (1) Check the following items before performing the setting-check operations or auto airflow volume operations.
  - 1) Check to make sure that the electrical wiring and ducting have been completed. Activate the stand-by mode. In particular, make sure that the closed damper located in the middle of the duct is open, if installed. Also, make sure that air filters have been installed inside the air inlet duct. Check to make sure air is not leaking from the joints.
  - 2) If multiple air outlets and air inlets are included, adjust the airflow volume ratio of all of them until they meet the design airflow ratio.
  - 3) Make sure the address setting has been completed.
- (2) The operation check will be completed in approximately three minutes if the settings have been made correctly. The settings will be modified if they are out of the range of use (maximum 30 minutes). If this is not completed within 31 minutes, check whether the air speed is set to “H” or not.

- (3) Refer to Table 1-11-7-3 and Fig. 1-11-7-16 for details on the relationship between the value of item code "b0" and the external static pressure.
- (4) When set in group control (connecting multiple indoor units with one wired remote controller), set each indoor unit to item code "b0". When amending the setting after selecting [ b. Manual setting] (due to airflow path changes, etc.), it is necessary to cancel [b. Manual setting] (disconnect short-circuit connector). When [b. Manual setting] has not been cancelled, [c. Manual setting] and [d. Auto airflow volume setting] will be activated if selected, but [b Manual setting] takes precedence when the power is switched back on after power outages, etc.
- (5) If this is not completed within 8 minutes, check the drive mode, air speed and air inlet temperature.
- (6) When set in group control (connecting multiple indoor units with one wired remote controller), the test run operations display will disappear once the external static pressure setting check or auto airflow volume control operation check have been completed for the main unit.  
Decisions on sub-unit complete are not possible.  
The test run operation display will disappear after one hour even if the external status pressure setting check or auto airflow volume control operation check have not been completed.

## CAUTION

- Be sure to check that the external static pressure is within the range for use and then make the setting.  
Failure to observe this may result in insufficient airflow or water leakages.  
Refer to Fig. 1-11-7-16 for the external static pressure setting range.
- There are cases in which automatic variable dampers and other mounted items may trigger the P12 alarm on systems that modify the static pressure of outdoor units when the auto airflow volume control operations or setting check operations are carried out if high static pressure in the outdoor unit is lowered.  
In this event, lower the dampers, etc., so that the static pressure in the outdoor unit reaches its lowest level, and then carry out the auto airflow volume control operations or setting check operations.
- Be sure to set the [External Static Pressure Setting] once again after amending the airflow path for the duct or air outlet after setting the external static pressure.
- Set the air inlet temperature within the range for use.  
The auto airflow volume control will not function if the air inlet temperature is over 45°C or not in the fan mode.

## 7-6. How to Set on PC Board

1. Turn off the power breaker to halt the supply of electricity to the PC board.
2. Open the lid of electrical component box and check where the short-circuit pin on the indoor unit control PC board is located (Fig. 1-11-7-15)
3. Short circuit the applicable short-circuit pin in accordance with the selected short-circuit pin connected (Table 1-11-7-2).

Table 1-11-7-2 Selection of connected short-circuit pins

| External static pressure at the time of rated airflow volume | Short-circuit pin |
|--|-------------------|
| Unusable   | TP6 (2P: white)   |
| line ⑮   | TP3 (2P: yellow)  |
| line ⑭   | TP1 (2P: red)     |

Fig. 1-11-7-15

### 7-7. Operating the Timer Remote Controller (CZ-RTC2)

Setting Item Code "60"

- Press and hold down the , and buttons simultaneously for 4 or more seconds.  
(**SETTING**, the Unit No., Item Code and Detailed Data will blink on the remote controller's LCD display.)
- The indoor unit numbers in the group control will be sequentially displayed whenever the Unit Select button is pressed .  
Only the fan motor for the selected indoor unit will operate during this.
- Specify the "60" item code by pressing the / buttons for the temperature setting buttons and confirm the values.  
( "-001" set at shipment )
- Press the / buttons for the time to amend the values for the set data.  
Refer to table 1-11-7-3 and Fig. 1-11-7-16 and select a value between "0001" and "0015".  
Select "-002" if the auto airflow volume setting is activated.
- Press the button.  
The display will stop blinking and remain illuminated.
- Press the button.  
The fan motor will stop operating and the LCD display will return to the normal stop mode.

Table 1-11-7-3 Setting the external static pressure

| Indoor unit  |               | Item code |
|--|---------------|-----------|
| 60, 71   | 100, 125, 140 | 60        |
| External static pressure of the rated air flow volume (Pa) |               |           |
| according to Indoor Unit P-Q diagram                       |               |           |
| 0015   |               |           |
| 0014   |               |           |
| 0013   |               |           |
| 0012   |               |           |
| 0011   |               |           |
| 0008   |               |           |
| 0006   |               |           |
| 0005   |               |           |
| 0003   |               |           |
| 0001   |               |           |
| No auto airflow volume setting                             |               | -001      |
| Auto airflow volume setting                                |               | -002      |

#### Auto Airflow Volume Control Operations and External Static Pressure Setting-Check Operation

- Press and hold down the button for 4 or more seconds. "TEST" will be displayed on the remote controller's LCD display.
- Press the button to commence the test run.  
[Test Run] will be displayed on the remote controller's LCD display.
- Select the fan mode and set it to "H" by pressing the button.

Auto airflow volume control operations and external static pressure setting-check operations will not be performed unless [H] has been selected for the fan mode.

- The fan motor will be activated and auto airflow volume control operations or external static pressure setting-check operations will commence.  
The power of the airflow will change while these operations are in progress.  
The external static pressure setting-check operations and auto airflow volume control operations will be completed in about 3 to 30 minutes.  
The "TEST" display will be extinguished from the remote controller's LCD display.
- Press the button to halt the test run.

\* Failure to set this parameter may result in decreased airflow and condensation.

Indoor Fan Performance

|     |   | Item code "b0" |         |         |         |         |         |         |         |         |         |         |         |   |   |   |   |   |   |  |

S-140PN1E5A P-Q diagram

Fig. 1-11-7-16

### 7-8. External Static Pressure Setting for AC Fan Motor Model

To apply to following models

- S-36PN1E5A , S-45PN1E5A , S-50PN1E5A

There are two tap connector located in indoor unit control box can be selected.

The "blue connector" is standard tap, use-as-is at shipment.

For high static pressure duct, switch Fan Motor connector to plug in boost tap "white connector" to elevate air volume.

## (Ducted)

| Part Name         | Figure  | Q'ty | Remarks                                     |
|-------------------|---|------|---|
| Washer            |  | 8    | For suspending indoor unit from ceiling     |
| Flare insulator   |  | 2    | For gas and liquid tubes                    |
| Hose band         |  | 5    | For securing drain hose                     |
| Foam drain socket |  | 1    | For drain hole (another side of drain hose) |
| Drain hose        |  | 1    |   |
| Flange            |  | 2    |   |
| Screw             |  | 4    | For inlet duct installation                 |

- Use M10 for suspension bolts.
- Suspension bolts and nuts are field supply.

## 8. 4-Way Cassette 60×60 Type (Y2)

### ■ SELECTING THE INSTALLATION SITE

#### Indoor Unit

#### AVOID:

- areas where leakage of flammable gas may be expected.
- places where large amounts of oil mist exist.
- direct sunlight.
- locations near heat sources which may affect the performance of the unit.
- locations where external air may enter the room directly. This may cause “condensation” on the air discharge ports, causing them to spray or drip water.
- locations where the remote controller will be splashed with water or affected by dampness or humidity.
- installing the remote controller behind curtains or furniture.
- locations where high-frequency emissions are generated.

#### DO:

- select an appropriate position from which every corner of the room can be uniformly cooled.
- select a location where the ceiling is strong enough to support the weight of the unit.

#### WARNING

**The installation position must be able to support a load four times the indoor unit weight.**

- select a location where tubing and drain pipe have the shortest run to the outdoor unit.
- allow room for operation and maintenance as well as unrestricted air flow around the unit.
- install the unit within the maximum elevation difference above or below the outdoor unit and within a total tubing length (L) from the outdoor unit as detailed in the installation manual packed with the outdoor unit.
- allow room for mounting the remote controller about 1m off the floor, in an area that is not in direct sunlight or in the flow of cool air from the indoor unit.

#### NOTE

Air delivery will be degraded if the distance from the floor to the ceiling is greater than 3 m.

#### 4-Way Cassette 60×60 Type

- \* If the height from the floor to ceiling exceeds three meters, air flow distribution deteriorates and the effect is decreased.

■ HOW TO INSTALL THE INDOOR UNIT

■ 4-Way Cassette 60×60 Type (Type Y2)

8-1. Preparation for Ceiling Suspension

This unit uses a drain pump. Use a carpenter's level to check that the unit is level.

8-2. Ceiling Opening Dimensions and Hanging Bolt Location

This air conditioner uses a drain up motor. Horizontally install the unit using a carpenter's level. The paper model for installation expand or shrink according to temperature and humidity. Check on dimensions before using it.

Fig. 1-11-8-1

During the installation, care must be taken not to damage electric wires.

- The dimensions of the paper model for installation are the same as those of the ceiling opening dimensions.
- Be sure to discuss the ceiling drilling work with the workers concerned.

8-3. Positions of Air Conditioner Body and Ceiling Surface

Note: Customers should purchase\* marked item.

Fig. 1-11-8-2

Fig. 1-11-8-3

Tighten the nut and bolt to prevent unit from falling.

8-4. Installing the Drain Pipe

Fig. 1-11-8-4

NOTE

Make sure the drain pipe has a downward gradient (1/100 or more) and that there are no water traps.

### 8-5. Indoor Unit Drain Piping

- During drain piping connection, be careful not to exert extra force on the drain port at the indoor unit.
- The outside diameter of the drain connection at the indoor unit is 32 mm.  
Piping material: Polyvinyl chloride pipe VP-25 and pipe fittings.
- Be sure to perform heat insulation on the drain piping.  
Heat insulation material: Polyethylene foam with thickness more than 8 mm (local supply).
- Drain piping must have down-slope (1/50 to 1/100); be sure not to provide up-and-down slope to prevent reversal flow.
- Be sure to check no air trap on drain hose and to ensure smooth water flow and no abnormal sound.
- The height of drain may be possible up to 750 mm.
- When drain set piping, install as shown in the figure below.

Fig. 1-11-8-5

Fig. 1-11-8-6

Fig. 1-11-8-7

Fig. 1-11-8-8

#### Drain Test

The air conditioner uses a drain up motor to drain water. Use the following procedure to test the drain up motor operation.

- Connect the main drain pipe to exterior and leave it provisionally until the test comes to an end.
- Feed water to the flexible drain hose and check the piping for leakage.
- Be sure to check the drain up motor for normal operating and noise when electric wiring is complete.
- When the test is complete, connect the flexible drain hose to the drain port.

Fig. 1-11-8-9

## 8-6. Connecting Tubing Between Indoor and Outdoor Units

(1) Tightly connect the indoor-side refrigerant tubing extended from the wall with the outdoor-side tubing.

Indoor Unit Tubing Connection (Q 1, Q 2... n-1)

|                    |       |    |    |
|--------------------|-------|----|----|
| Indoor unit type   | 36    | 45 | 50 |
| Gas tubing (mm)    | ø12.7 |    |    |
| Liquid tubing (mm) | ø6.35 |    |    |

(2) To fasten the flare nuts, apply specified torque.

- When removing the flare nuts from the tubing connections, or when tightening them after connecting the tubing, be sure to use 2 adjustable wrenches or spanners. (Fig. 1-11-8-10) If the flare nuts are over-tightened, the flare may be damaged, which could result in refrigerant leakage and cause injury or asphyxiation to room occupants.
- For the flare nuts at tubing connections, be sure to use the flare nuts that were supplied with the unit, or else flare nuts for R410A (type 2). The refrigerant tubing that is used must be of the correct wall thickness as shown in the table below.

Fig. 1-11-8-10

| Tube diameter | Tightening torque (approximate)       | Tube thickness |
|---------------|---------------------------------------|----------------|
| ø6.35 (1/4")  | 14 – 18 N · m<br>{140 – 180 kgf · cm} | 0.8 mm         |
| ø9.52 (3/8")  | 34 – 42 N · m<br>{340 – 420 kgf · cm} | 0.8 mm         |
| ø12.7 (1/2")  | 49 – 61 N · m<br>{490 – 610 kgf · cm} | 0.8 mm         |
| ø15.88 (5/8") | 68 – 82 N · m<br>{680 – 820 kgf · cm} | 1.0 mm         |

Because the pressure is approximately 1.6 times higher than conventional refrigerant pressure, the use of ordinary flare nuts (type 1) or thin-walled tubes may result in tube rupture, injury, or asphyxiation caused by refrigerant leakage.

- In order to prevent damage to the flare caused by over-tightening of the flare nuts, use the table above as a guide when tightening.
- When tightening the flare nut on the liquid tube, use an adjustable wrench with a nominal handle length of 200 mm.

## 8-7. Insulating the Refrigerant Tubing

### Tubing Insulation

- Thermal insulation must be applied to all units tubing, including distribution joint (local supply).
    - \* For gas tubing, the insulation material must be heat resistant to 120°C or above. For other tubing, it must be heat resistant to 80°C or above.
- Insulation material thickness must be 10 mm or greater.  
If the conditions inside the ceiling exceed DB 30°C and RH 70%, increase the thickness of the gas tubing insulation material by 1 step.

Fig. 1-11-8-11

**CAUTION**

If the exterior of the outdoor unit valves has been finished with a square duct covering, make sure you allow sufficient space to access the valves and to allow the panels to be attached and removed.

### Taping the flare nuts

Wind the white insulation tape around the flare nuts at the gas tube connections. Then cover up the tubing connections with the flare insulator, and fill the gap at the union with the supplied black insulation tape. Finally, fasten the insulator at both ends with the supplied vinyl clamps. (Fig. 1-11-8-12)

**Heat Insulation**

**Be sure to perform heat insulation on the drain, liquid and gas piping.**  
**Imperfection in heat insulation work leads to water leakage.**

- (1) Use the heat insulation material for the refrigerant piping which has an excellent heat-resistance (over 120°C).
- (2) Precautions in high humidity circumstance.  
 This air conditioner has been tested according to the "JIS Standard Conditions with Mist" and have been confirmed that there are no faults. However, if it is operated for a long time in high humid atmosphere (dew point temperature: more than 23°C), water drops are liable to fall. In this case, add heat insulation material according to the following procedure:

- Heat insulation material to be prepared... Adiabatic glass wool with thickness 10 to 20 mm.
- Stick glass wool on all air conditioners that are located in ceiling atmosphere.
- In addition to the normal heat insulation (thickness: more than 8 mm) for refrigerant piping (gas piping: thick piping) and drain piping, add a further of 10 mm to 30 mm thickness material.

**Fig. 1-11-8-12**

**Wall seal**

- When the outdoor unit is installed on a higher position than the indoor unit, install the trap so as not to instill rain water into the wall by transmitting in piping.
- Stuff the space among piping, the electric wire, and the drain hose with putty and seal the penetration wall hole. Make sure that rain water do not instill into the wall.

\* Put the incision at the trap part of the heat insulator (for water drain)

**Fig. 1-11-8-13**

**8-8. Taping the Tubes**

- (1) At this time, the refrigerant tubes (and electrical wiring if local codes permit) should be taped together with armoring tape in 1 bundle. To prevent condensation from overflowing the drain pan, keep the drain hose separate from the refrigerant tubing.
- (2) Wrap the armoring tape from the bottom of the outdoor unit to the top of the tubing where it enters the wall. As you wrap the tubing, overlap half of each previous tape turn.
- (3) Clamp the tubing bundle to the wall, using 1 clamp approx. each meter. (Fig. 1-11-8-14)

**Fig. 1-11-8-14**

**NOTE**

Do not wind the armoring tape too tightly since this will decrease the heat insulation effect. Also ensure that the condensation drain hose splits away from the bundle and drips clear of the unit and the tubing.

**8-9. Finishing the Installation**

After finishing insulating and taping over the tubing, use sealing putty to seal off the hole in the wall to prevent rain and draft from entering. (Fig. 1-11-8-15)

**Fig. 1-11-8-15**

## 8-10. Installation of Decorative Panel

When using the wireless remote controller, follow the step 8-10-3 "When Using Wireless Remote Controller Instead of Wired Remote Controller" before installing the decorative panel.

### 8-10-1. Before Installing the Decorative Panel

- (1) Remove the air-intake grille and air filter from the decorative panel.
  - Remove the 2 screws on the latch of the air-intake grille. (Fig. 1-11-8-16) (Reattach the air-intake grille after installation of the decorative panel.)

Fig. 1-11-8-16

### 8-10-2. Installing the Decorative Panel

The decorative panel has its installation direction. Confirm the direction by displaying the piping side.

- (1) Remove the air inlet grille by moving the catchers to center.

Fig. 1-11-8-17

Fig. 1-11-8-18

\* Hang the hinge on the hole of decorative panel. (The direction of the installation is free.)

- (2) Fitting the decorative panel

- Temporarily secure the fixing screws (3 pcs.) before fitting the decorative panel. (For temporarily securing the front grille.)
- Place decorative panel on the screws (3 pcs.) before fitting, move decorative panel as illustrated and tighten all the screws (4 pcs.).

### CAUTION

- Check before hand the height from the ceiling to the unit.
- The front grille fitting direction is determined by the unit direction.
- Only use the screws with the length of 35 mm which is provided, to fix the decorative panel.
- Do not use other screw which is longer it may cause damage to the drain-pan and other components.

Fig. 1-11-8-19

- (3) Fit the decorative panel and ceiling wall together, making sure that there is no gap between the two. Readjust indoor unit height, if there is a gap between ceiling wall and decorative panel.

**Example of PROPER installation**

Fit the insulator (this part) and be careful for cool air leakage.

Fig. 1-11-8-20

**Example of IMPROPER installation**

Fig. 1-11-8-21

- (4) Open the indoor control box cover. (3 pcs. screws)  
 (5) Insert firmly the connector of cosmetic louver to indoor PCB LM and WL.  
 Be caution not to clamp the cord in between control board and control board cover.  
 (6) After completing the aforementioned, install the removed part by reversing the steps for removal.

Fig. 1-11-8-22

**! WARNING**

Be sure to hook the air inlet grille string, to prevent grille from falling and causing injury from it.

Fig. 1-11-8-23

**8-10-3. When Using Wireless Remote Controller Instead of Wired Remote Controller**

When the wireless remote controller is to be used, slide the switch (SW502) on the indoor unit control PCB to the ON position.

- If this setting is not made, an alarm will occur. (The operation lamp on the display blinks.)

Reverse side view of Decorative Panel

Remove 3 screws and panel cover

PCB inside panel cover

Setting status  
**ON:** Wireless: main, Wired: sub  
**OFF:** Wired: main, Wireless: sub (at shipment)

**(4-Way Cassette 60×60)**

| Part Name              | Figure  | Q'ty |
|------------------------|---|------|
| Drain hose with a clip |  | 1    |
| Heat Insulator         |  | 2    |
| Band                   |  | 4    |
| Flat washer for M10    |  | 8    |

| Part Name                 | Figure  | Q'ty |

| Installation Instructions |  | 1    |

- Use M10 for hanging bolts.
- Field supply for hanging bolts and nuts.

## 1-12. How to select AHU system

### AHU system selection guideline

#### ● System lineup

| Capacity | Outdoor combination |             | Connectable AHU-kit combination |            |
|----------|---------------------|-------------|---------------------------------|------------|
|          | U-100PE1E8A         | U-100PE1E5A | CZ-280PAH1                      | CZ-280PAH1 |
| 10 kW    | U-100PE1E8A         | U-100PE1E5A | CZ-280PAH1                      | CZ-280PAH1 |
| 12.5 kW  | U-125PE1E8A         | U-125PE1E5A | CZ-280PAH1                      | CZ-280PAH1 |
| 14 kW    | U-140PE1E8A         | U-140PE1E5A | CZ-280PAH1                      | CZ-280PAH1 |

- \* Single connection type only
- \* Mix connection with standard indoor units is not allowed.
- \* The system is applicable to the above models.

#### ● System Overview

Single connection

- A: AHU kit controller box (with control PCB)
- B: AHU equipment (Field supplied)
- C: AHU kit controller (Option parts)
- D: Outdoor unit
- E: Gas piping (Field supplied)
- F: Liquid piping (Field supplied)
- G: Thermistor for Liquid pipe (E1)
- H: Thermistor for Heat exchanger pipe middle (E2)
- I: Thermistor for Suction air (TA)
- J: Inter-unit wiring
- K: Magnetic relay for operating the blower (Field supplied)

#### ● Piping design regulation

- Connecting pipe dimension to heat exchanger of AHU

| Capacity | Model name | Liquid pipe | Gas pipe |
|----------|------------|-------------|----------|
| 10-14kW  | CZ-280PAH1 | ø9.52mm     | ø15.88mm |

- System piping length (Charging with refrigerant)

At the time of shipment from the factory, the outdoor unit is charged with enough refrigerant for an equivalent pipe length of 30m.

If the equivalent piping length used is 30m or less, no additional charge will be necessary.

If the equivalent piping length is between 30 and 50m, charge with additional refrigerant according to the equivalent length given in the following table.

| Capacity | Additional charge amount | Equivalent length | Minimum length |
|----------|--------------------------|-------------------|----------------|
| 10-14kW  | 50g/m                    | 50m               | 5m             |

## ● Installation

### ▪ Installation of Strainer (Field supplied)

Attach the strainer to the side of the outdoor unit for Gas & Liquid piping.  
(See the "System Overview" on previous page.)

### ▪ Thermistor for Liquid pipe and Heat exchanger pipe middle

#### Liquid pipe thermistor

Attach the liquid pipe thermistor to the liquid pipe located in the lowest position after distributor in heat exchanger.

Cover the thermistor and pipe with aluminum tape.

Cover the aluminum tape with thermal insulation.

Thermal insulation and wiring are fixed in two bands.

#### Heat exchanger pipe thermistor

Attach the heat exchanger pipe thermistor in the middle of each pass-line (pipe) in the heat exchanger.

Cover the thermistor and pipe with aluminum tape.

The thermistor is fixed in band. Then, it must not make tension to the wire.

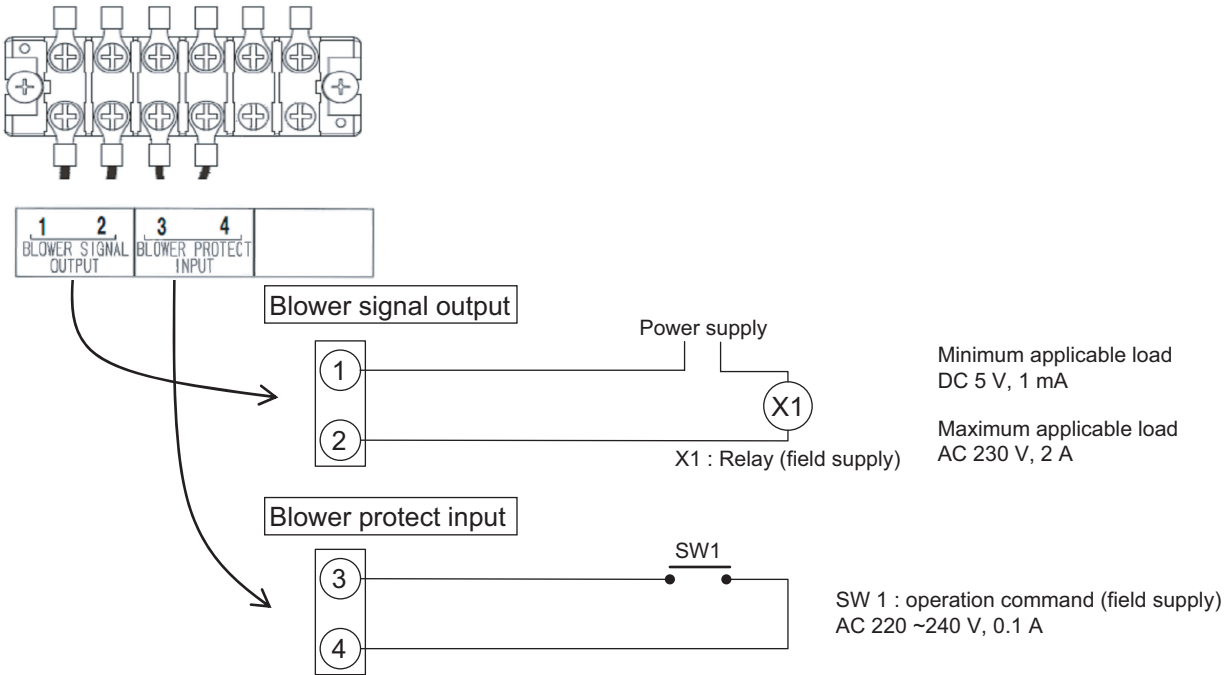

Cover the aluminum tape with thermal insulation. And also cover sensor (copper portion) with thermal insulation completely.

### ▪ Attachment of NOTES Label (Supplied parts)

Please be sure to apply the NOTES label at the designated area of the outdoor unit when cutting a jumper wire on the circuit board.

▪ Blower operation signal and protection signal

● Limitation of AHU

When the AHU is selected, there are some limitations.

- The limitation of temperature range is shown below.

|  |      | Cooling              | Heating     |
|--|------|----------------------|-------------|
| Outdoor temperature                              | Min. | -10 °C (DB)          | -20 °C (WB) |
|  | Max. | 43 °C (DB)           | 15 °C (WB)  |
| Inlet air temperature<br>(to the heat exchanger) | Min. | 18 °C (DB)           | 16 °C (DB)  |
|  | Max. | 32 °C(DB) / 23°C(WB) | 30 °C (DB)  |

- The limitation of Heat exchanger volume, Air volume and Front area is shown in the following Table 1-12-1, 1-12-2 and 1-12-3.

Table 1-12-1 : Inside volume of heat exchanger

| Cooling Capacity      |      | 10 kW               | 12.5 kW             | 14 kW               |
|-----------------------|------|---------------------|---------------------|---------------------|
| Heat exchanger volume | Max. | 2.1 dm <sup>3</sup> | 2.1 dm <sup>3</sup> | 2.1 dm <sup>3</sup> |
|                       | Min. | 1.7 dm <sup>3</sup> | 1.7 dm <sup>3</sup> | 1.7 dm <sup>3</sup> |

Table 1-12-2 : Air volume of heat exchanger

| Cooling Capacity |      | 10 kW                  | 12.5 kW                | 14 kW                  |
|------------------|------|------------------------|------------------------|------------------------|
| Air volume       | Max. | 1980 m <sup>3</sup> /h | 2100 m <sup>3</sup> /h | 2160 m <sup>3</sup> /h |
|                  | Min. | 840 m <sup>3</sup> /h  | 1140 m <sup>3</sup> /h | 1140 m <sup>3</sup> /h |

Table 1-12-3 : Front area of heat exchanger

| Cooling Capacity |      | 10 kW               | 12.5 kW             | 14 kW               |
|------------------|------|---------------------|---------------------|---------------------|
| Front area       | Max. | 0.51 m <sup>2</sup> | 0.51 m <sup>2</sup> | 0.51 m <sup>2</sup> |
|                  | Min. | 0.43 m <sup>2</sup> | 0.43 m <sup>2</sup> | 0.43 m <sup>2</sup> |

● Restriction on the number of passes of the heat exchanger hairpin

Minimum number of passes

$$= \text{Number of steps} \times \text{Distance between tube sheets} \times \text{Number of rows} \times 1.5 \times 10^{-4}$$

<For example>

Number of steps : 12

Distance between tube sheets : 1000 [mm]

Number of rows : 3

$$\therefore \text{Minimum number of passes} = 12 \times 1000 \times 3 \times 1.5 \times 10^{-4} = 5.4 < 6 \text{ passes}$$

1-13. Capacity Table

1. Cooling Capacity Performance Data

TC :Cooling Capacity

SHC :Sensible Heat Capacity

IPT :Cooling Power Consumption

• Combination of Single Unit

unit : kW

4-Way Cassette Type

ENERGIA EHEPTIR - ENERPIJA - ENERGIJA - ENERGI - ENERGI - ENERGI  
6/26/2011

- ① : Panasonic Corporation
- ② : Model Name
- ③ : SEER Grading
- ④ : SCOP Grading (Standard, mandatory)
- ⑤ : SCOP Grading (Warmer, optional)
- ⑥ : SCOP Grading (Colder, optional)
- ⑦ : Design Load kW (round up to one decimal) <Cooling>
- ⑧ : SEER (round up to one decimal)
- ⑨ : Annual Energy Consumption (rounded <Cooling> up to the nearest integer)
- ⑩ : Design Load kW (round up to one decimal) <Heating>
- ⑪ : SCOP (round up to one decimal) <Heating>
- ⑫ : Annual Energy Consumption (rounded up to the nearest integer) <Heating>
- ⑬ : Sound Power level for all indoor units dB (cooling)
- ⑭ : Sound Power level for all outdoor units dB (cooling)
- ⑮ : Sound Power level for all indoor units dB (heating)
- ⑯ : Sound Power level for all outdoor units dB (heating)
- ⑰ : backup heating capacity X,Y,Z kW name of refrigerant and GWP R410A (GWP 1975)
- ⑱ : Refrigerant leakage contributes to climate change. Refrigerant with lower global warming potential (GWP) would contribute less to global warming than a refrigerant with higher GWP, if leaked to the atmosphere. This appliance contains a refrigerant fluid with a GWP equal to 1975. This means that if 1 kg of this refrigerant fluid would be leaked to the atmosphere, the impact on global warming would be 1975 times higher than 1 kg of CO<sub>2</sub>, over a period of 100 years. Never try to interfere with the refrigerant circuit yourself or disassemble the product yourself and always ask a professional.
- ⑳ : Explanation on annual energy consumption based on standard test results. Actual energy consumption will depend on how the appliance is used and where it is located.
